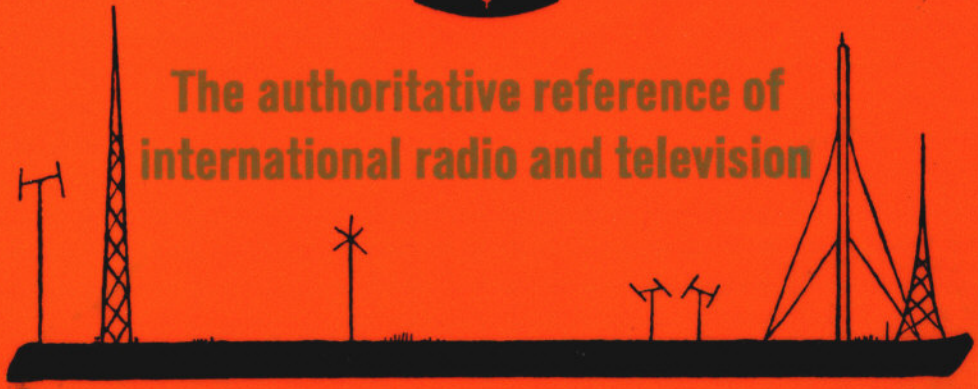
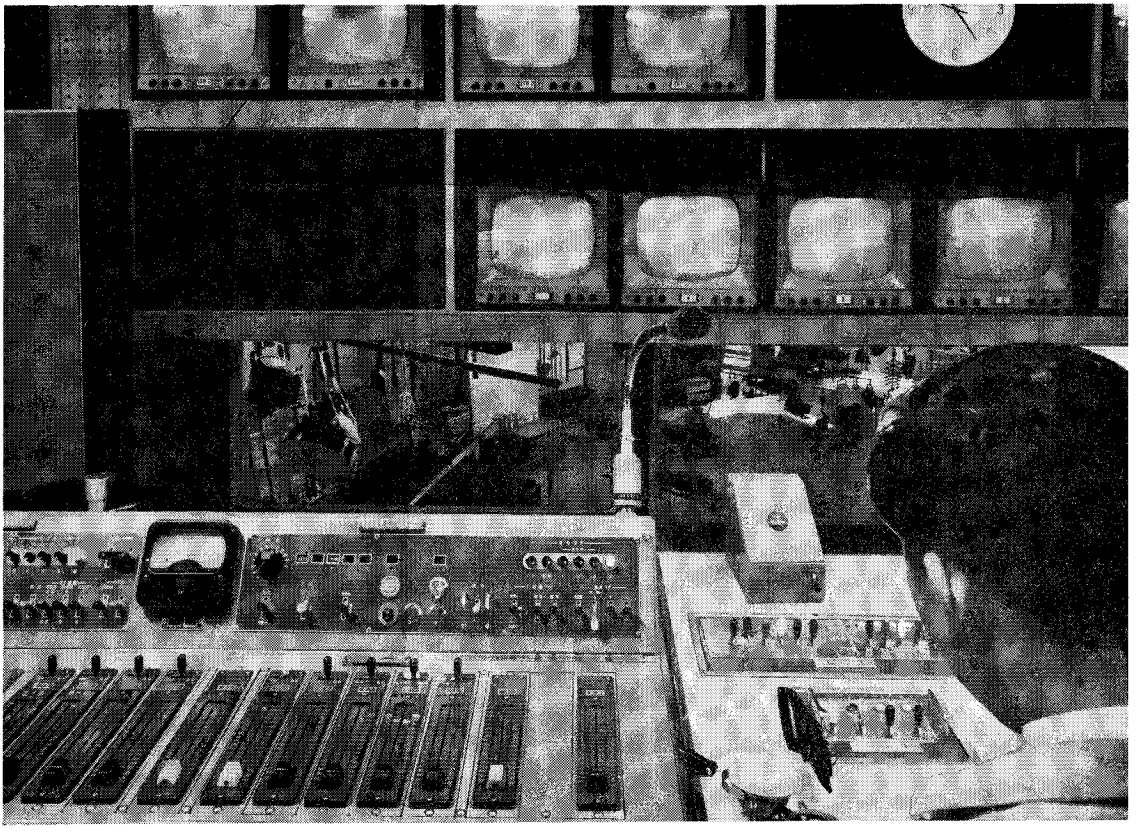
WORLD RADIO TV HANDBOOK

1965 • 19th. edition

The authoritative reference of international radio and television





NEC's Wide Range of Integrated Broadcasting Systems – Geared to meet any demand anywhere!

NEC, a world leader in the manufacture of telecommunications and electronics equipment, has designed and installed a wide range of integrated broadcasting systems throughout the world. These include everything from radio and TV stations to the satellite ground station at Kashima on the outskirts of Tokyo, making possible the telecast relay of the Tokyo Olympic Games across the Pacific via Syncom III. Indeed, NEC is geared to meet any requirement for integrated radio and TV broadcasting systems—from compact transistorized studio equipment to VHF and UHF transmitters and antennas as well as microwave relay facilities.

It goes without saying that all NEC equipment is designed for easy accessability, simple maintenance and minimum power consumption. It meets the highest international broadcast standards of signal quality, stability and reliability such as FCC, CCIR, etc. At present, 161 radio and 206 television broadcasting stations equipped with NEC systems are in operation or under construction both in Japan and overseas.

At last! A quality microphone designed **specifically** for the ham. Incorporates features galore that hams have asked for. Tops in voice punch and intelligibility . . . and abounding in convenience features to minimize operator fatigue. Great for AM & FM transmission, unsurpassed for SSB. Check these outstanding ham-oriented features:

- "Shaped" response—cuts off sharply above 3000 and below 300 cps with a rising characteristic to the curve: gets the message through with top audio punch!
- Push-to-talk bar-switch with optional locking feature to control relay and mike muting circuits.
- Separate slide-switch gives choice of press-to-talk or VOX operation.
- Exclusive adjustable height stand for fatigue-free operation.
- Rugged Shure Controlled Magnetic element (U.S. Patent 2,454,425).
- Field replaceable cartridge and cable.
- ARMO-DUR case and stand—can't rust, peel, crack, or dent. Always comfortable to the touch.
- Shock proof.

Henrik Hahr

When the European Broadcasting Union (EBU) was formed in Torquay in February 1950 only a limited number of broadcasting services had introduced regular television programmes. Today—when the General Assembly meets—the interest is in a very high degree directed towards all the intricate problems which have followed the rapid development of international television.

The procedures of satellite transmissions, the approach of colour television, several new and difficult legal questions as well as numerous already familiar problems of the television world today are consequently on the agenda of the EBU.

It would be wrong, however, to assume that only television is occupying the minds of all the distinguished directors-general and their experts and the permanent services of the EBU in Geneva and Brussels. At its last meeting in Vienna in June 1964, the General Assembly created a new committee — a Sound Broadcasting Programme Committee which will take its place beside already existing committees, i. e. the Legal and Technical Committees and the Programme Committee for Television. The problems of sound radio are now of such importance that creation of a permanent body is regarded as highly justified. Two aspects are stressed in the connection: the necessity of assistance to developing countries where television has still a long way to go, and the position of sound radio as a medium in its own right beside the television services of the world.

From being a rather small gathering, the EBU has now grown into an important organization with worldwide connections. The active members from countries situated in the European Broadcasting Zone as defined by the European Broadcasting Convention consist of 28 broadcasting services in 25 countries. The associate members—to be found in all continents outside Europe—number 37 broadcasting organizations in 27 countries including the USA.

It is characteristic of the work of the EBU today that it is at the same time to be compared with what is going on in important international bodies and what is happening in the departments of programme planning and foreign relations and in the control rooms of national broadcasting organizations with regular programme services. The EBU is consequently a platform for deliberations, discussions and common decisions as well as an international concern with day-to-day operations consisting of international exchange of programmes mostly within the area of Eurovision. This twofold task of the union gives it a special position among international organizations and adds a special flavour to the work.

There is, indeed, much work to be done and even more in the future. The "summit" meeting in Helsinki in June 1964 between the presidents and other representatives of the EBU and its counterpart in eastern Europe, OIRT, shows clear tendencies to widen the contacts. To this should be added the discussions which have been had with the President of the URTNA, the African broadcasting union, and with representatives of the new Asian broadcasting union, as well as with the American broadcasting services.

A final word should be said concerning the positive results achieved during the Second World Conference on School Broadcasting in Tokyo in 1964. The first international conference of this kind, promoted by the EBU following a proposal of one of its Vice-Presidents, Mr. Rodinò, and organized by the RAI in Rome in 1961, showed the great possibilities of international cooperation in this field. The Tokyo Conference, organized by the NHK under the auspices of the EBU and presided over by Mr. Rodinò, confirmed the importance and the necessity of these professional gatherings. Consequently the EBU and its members are looking forward with great expectation to the third conference of the kind which the ORTF has kindly offered to organize in Paris in 1967.

The EBU's capacities are those of its members. It is of great importance for this union to be able to elect as its leaders eminent experts and personalities. During the General Assembly in Vienna the union unanimously elected Mr. Marcello Rodinò as President as from the 1st January, 1965. Mr. Olof Rydbeck, Director General of the Sveriges Radio, who had been President during four eventful years, was elected Honorary President as a recognition of his excellent leadership and the great services he had rendered the EBU.

The activities of the EBU are of an all-embracing kind concerning broadcasting matters. Different opinions are put forward and debated but in the end good and sound solutions always seem to be found, owing to the fact that the EBU as a professional, non-political organization groups together experts with concrete knowledge of broadcasting and a will to do their best for the listening and viewing public. In that respect we welcome all information that can be given on a large scale about the possibilities of broadcasting in the world today. I take this opportunity to wish you every success with the publication of the 19th edition of the World Radio TV Handbook.

HENRIK HAHR
Director, EBU Administrative Office
Geneva

Frank S. Cook

It is an undeniable fact that there is a direct relationship between privilege and responsibility. The greater the privileges enjoyed by an individual or a nation, the greater the responsibility enjoined upon that individual or that nation. This is particularly true in the ministry of broadcasting and television. And we use the term "ministry" advisedly, for broadcasting and television have long ago ceased to be merely a means of mass entertainment. It still is that, but far more important, it is the means of moulding the thinking and consequently the actions of millions who daily sit by their radios in their homes, in public places and in auto-

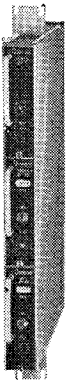
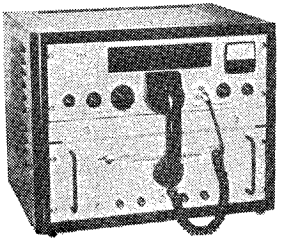
1 TELETYPE MODEL 15 SEND-RECEIVE PAGE PRINTER

110 volts, 60 cycle synchronous motor with standard communication typeface arrangement. (CCIT #2) Complete with table, relay and gears for 60 words per minute. Manufactured to Teletype Corporation's precision standards for dependable service.



2 RADIO-TELETYPE TONE SIGNALING SYSTEM

Consists of frame, transmitter, receiver and combination power supply & DC loop. Modular, plug-in design; completely transistorized. Designed for ease of maintenance and service.



3 TRANSCEIVER

The first completely new and modern single sideband radio-telephone! Uses ultra-modern tubes and circuits specifically designed for single sideband applications. Mechanical filter prevents interference from unwanted off-frequency signals. Full 150 watts P.E.P. **continuous duty** output; 4 channels anywhere within a 3 to 15 mc. band. Provides voice and CW facilities in addition to teletype. Complete with telephone handset, all tubes, crystals and coils for one channel.

***Complete, only* $1,995.00** F.O.B. Factory, N.Y.

NOTE: Teletype and accessories, terminal equipment and transceiver, available separately on request. Other systems can be tailored to your requirements. (Utilizing automatic send-receive or receive-only Teletypes; tape readers; tape punches; also VHF-FM, AM or Single Sideband radios in many configurations.)

mobiles. What a man thinks and does will be governed largely by what he sees and hears. What he sees and hears is largely the responsibility of the broadcasters.

The increased number of radio and television stations, made evident by the listings in the World Radio Television Handbook, and the increased number of listeners, made evident by the ubiquitous transistor radio and television receivers, increases our privileges—the privilege of having a share in the direction of the thoughts and destiny of mankind. That very privilege increases our responsibility, for what the world may be tomorrow will depend largely upon us. Thus the need increases for an increasingly responsible broadcasting ministry.

For thirty-three years The Voice of the Andes, Radio Station HCJB, whose studios and transmitters are located in the beautiful and hospitable land of Ecuador, has tried to keep in mind this responsibility. Owned and operated by the World Radio Missionary Fellowship, Inc., its broadcasting ministry has a twofold thrust; to *H*erald *C*hrist *J*esus' *B*lessings in its spiritual aspect, and to disseminate the best in music, news and education. That we have been successful in this is evidenced by the mail response last year of thousands upon thousands of letters from listeners in over 115 different countries.

As another edition of the World Radio Television Handbook is published, may we as broadcasters keep in mind our responsibility to God and to man.

FRANK S. COOK
Station Manager of HCJB, The Voice of The Andes

Dr. L. F. Tijmstra

The immeasurable value of modern means of communication, such as radio and television, has been stressed so often, and in so many ways, and with such well-founded arguments, that it seems hardly feasible to add any new and original ideas. All the same, one is readily prepared to write a foreword to the indispensable guide which the WORLD RADIO AND TELEVISION HANDBOOK undoubtedly is, as in this way it is possible to express one's conviction that both radio and television have a permanent and ever more important task to fulfil in a world whose physical proportions are admittedly becoming smaller, but in which there is still much to do in the way of bridging spiritual distances.

Radio and television, each in its own way, can make a lasting contribution to the spreading of knowledge and insight concerning the thinking and customs of neighbouring and far-off countries, as well as of one's own. It seems almost a platitude to say that radio and television are therefore unique media for strengthening mutual understanding between countries and population groups. Language lessons by radio, and coverages of, say, each other's activities in agriculture, trade and industry can help in this way. But to ascertain this might easily be construed as savouring of pedantry, and so conjure up a one-sided picture. However, radio and television have much more to offer than the aspects just mentioned. One need only think of the providing of simple relaxation and first-class artistic fare, which give pleassure to many over vast areas. Especially to those in lonely outposts, often thousands of miles away in sparsely peopled regions, these things can mean much. The stream of mail received by many radio stations bears witness to this.

Radio and television, if rightly employed, can thus be regarded as valuable expedients in the widening of understanding, in the providing of pleasure, and in the alleviating of loneliness. The perfection of these media is the goal upon which our efforts are turned, and in this activity the WORLD RADIO AND TELEVISION HANDBOOK has for long been rendering invaluable services.

DR. L. F. TIJMSTRA
Director-General
Radio Nederland, Hilversum, Holland

Yoshinori Maeda

NHK has a history of 40 years' radio and 12 years' television broadcasting, and as Japan's sole national service broadcasting organization financed by the subscription fees collected by ourselves from 19 million listening and viewing households, has won the confidence of the nation.

At present NHK's First Radio Network covers 99.7% of the total households and Second Radio Network 98.2%, while its General TV covers 89% Educational TV 87%. Therefore it is my earnest hope to make the coverage 100% as soon as possible by building more stations.

The enterprise has been established on the basis of the advancement of natural and social sciences, and I believe that broadcasting is a mass communication medium through which people of the world can mutually understand each other. Broadcasters therefore have the responsibility of fostering broadcasting as a medium which can contribute toward the establishment of world peace through mutual understanding among all nations. Thus, those of us who are engaged in broadcasting shoulder a great responsibility.

As a means to this end, NHK has been conducting exchanges of radio and TV programs with various overseas broadcasting organizations and we intend to positively carry out these exchanges in the future. For this purpose I also believe that broadcasting organizations of the world should make every effort to unite. This is not a self-justified idea of mine, for to give an example, in Europe there is the European Broadcasting Union and in Asia, the Asian Broadcasting Union has been formed, bringing together the broadcasting organizations of the Asian region.

At the Second International Conference of Broadcasting Organization on Sound and Television School Broadcasting held by NHK in Tokyo in April 1964 at the request of the EBU, I expressed this idea of a world broadcasting organization to the participating delegates from major world broadcasting organizations. They agreed to my idea and as a result, possibility has arisen of establishing a world broadcasting union.

In this regard, international space relay techniques which have entered the practical stage will be of a great significance in exchanges of programs among world broadcasting organizations.

The last year proved a memorable one for NHK. As already mentioned, the preparation organized and held in April the Second International Conference of Broadcasting Organizations on Sound and Television School Broadcasting and NHK's radio and TV educational programs and correspondence high school programs intended for working young men and women were praised highly by the participants as models of school broadcasting.

In October last year, NHK, authorized by the Internationale Olympic Committee, successfully conducted history's greatest radio and TV broadcasts of the Tokyo Olympics. On the occasion NHK extended its cooperation to various overseas broadcasting organizations for their Olympic broadcasting. We feel it a great honor for NHK to be praised and appreciated for the successful Olympic broadcasts and for the excellent cooperation extended to foreign broadcasters.

I am certain that those who visited Japan to participate in these two important events recognized, through direct association with NHK, the position which the corporation occupies in Japan.

We of NHK are determined to advocate and recommend to foreign broadcasters what we think is right and to contribute towards the establishment of world peace and prosperity through broadcasting on the basis of Japan's national policy.

YOSHINORI MAEDA
President of Nippon Hoso Kyokai
(The Japan Broadcasting Corp.)

Josef Nichols

"Nation Shall Speak Peace Unto Nation".—The year 1965 is of the greatest importance to the international community. It is the twentieth anniversary of the United Nations and has been designated by the "General Assembly as International Co-operation Year". Significantly, it also marks the centenary of the International Telecommunication Union.

What giant steps have been made in the field of telecommunications, in broadcasting and in television from that memorable day, October 23, 1946, when the world heard for the first time our opening announcement: "This is United Nations Radio, calling the People of the World!" Since then, United Nations microphones, film and television cameras have witnessed many significant events around the world, recorded history while it was being made, and have seen the birth of new nations, large and small. United Nations Radio and Visual Services not only disseminated the news from the United Nations but also presented its meaning and its significance. Thus, by means of powerful transmitters, with the co-operation of many national broadcasting organizations, through the use of "Telstar", "Relay" and "Syncom" communications satellites, it helped to diminish the size of the world. Science, through its amazing discoveries in the field of communications, has placed into our hands not only a powerful weapon but also a challenge to the ingenuity of man, to his will to conquer fear and harness world communications into a constructive means for understanding and co-operation among nations.

Today, every country realizes the need for a powerful globe-girding voice of peace. This can only be achieved through international co-operation encompassing all broadcasting organizations of the world. This is the challenge, the motive, the hope of 1965, the "Year of International Co-operation".

JOSEF C. NICHOLS
Operations Manager
Radio and Visual Services Division
United Nations

P. J. Meyer

The mass communications media, of which radio is the one with the greatest impact in South Africa, have a responsible task in helping to build a better world by spreading reliable information to all nations. As soon as these media are suspected of dispensing propaganda, their fate is sealed. People are not sheep; they have finely-tuned antennae of their own which tell them when they are deceived. Untruths and halftruths become casualties; the truth survives.

Happy, quiet, prosperous South Africa has a message of hope and confidence for the strife-torn world, and the S.A.B.C. as South Africa's mouthpiece, extends her greetings and co-operation to fellow broadcasters everywhere through the World Radio TV Handbook.

PIETER J. MEYER
President of the Board of Governors,
South African Broadcasting Corporation

Dr. G. H. Padel

A number of people—including some Swiss—ask why this country, one of the smallest in the world, should have a short-wave service. In the very beginning, in the clouded days before the war, the reason was clear: More than one tenth of Switzerland's population had migrated to other European countries or overseas; but they still remained Swiss by nationality. Therefore, in view of the cataclysm that Europe was expecting in the thirties, some link with Switzerland, beyond censorship and mail delays, was necessary.

But speedily, as the Nazi forces occupied more and more of Europe, it was obvious that Switzerland had a second task in the shortwave field: as a neutral observer its political comment could pierce the mists of propaganda and try to get closer to the truth.

Not that the Swiss European & Overseas Service has ever been an official voice of Switzerland. Our organisation is completely free from Government intervention, for the Federal Government prefers to leave us the right of free speech, in line, naturally, with our charter, which is a very liberal

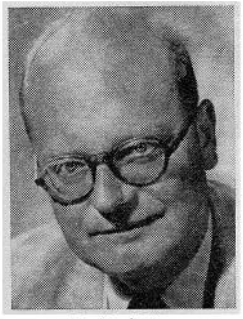
one. This means that our news is as objective as we can make it, and that our commentators have no axes to grind: they merely express their own free opinions.

However, in line with a fairly recent measure in Swiss foreign policy, we *are* running parallel to Government policy—not in content, but in planning. Just as the Swiss Government decided a few years ago to set up a bureau for technical co-operation with the developing countries, so we decided to aim our broadcasts more and more towards developing countries, realising that they were more in need of information than the industrialised countries. Thus, we have set up a service in French and for French-speaking Africa, and in 1964, an Arabic Programme, servicing the Middle East and North Africa.

Not that this means that we are forgetting our old friends on the European Continent, in Britain and Ireland, in the United States or Asia and English-speaking Africa, any more than our long-standing listeners to programmes beamed to South and Central America in Spanish and Portuguese. The recent work we have carried out is an expansion, and we look forward to more expansion in the future, as we do more and more close collaboration with the World Radio and TV Handbook, one of the most helpful documents in broadcasting.

DR. G. H. PADEL
Director Swiss Shortwave Service



Sir Hugh Greene

The past year has been a time of great development for the BBC. In television, we began our second channel—BBC-2. Amongst its first programmes was the documentary series on "The Great War" which has now achieved international fame and has been seen by viewers in many countries. 1964 also brought one of the most important developments in BBC radio since it began more than 40 years ago. The Light Programme has been extended and now runs for more than 20 hours a day. A new, daily programme of good music has also been launched.

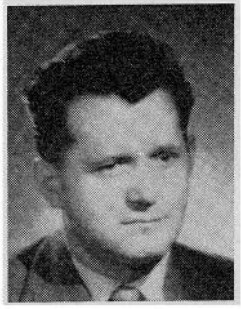
But developments in the international field have been equally important. For the BBC, a turning-point came in external broadcasting when, after 15 years of intentional interference, all Communist jamming of our European Service broadcasts came to an end in June 1964.

The BBC continued to provide many thousands of television programmes and radio transcription programmes to stations in more than 100 countries. Great importance was attached to helping the new services of the world with television material. We also continued to handle or give assistance with a great number of television transmissions via satellite and participated on the European network in many hundreds of programme exchanges.

The BBC is proud of the fact that its External Services continued to be rebroadcast regularly in more than 60 different countries by more than 100 different radio organisations (not counting radio stations in the United States). In addition, many thousands of radio programmes were exchanged last year between the BBC and broadcasting centres as far apart as Finland and Japan. Special courses and attachments were arranged for visitors from broadcasting stations in emergent countries. There was also considerable interchange of scripts and information with other radio and television organisations.

The BBC values very highly its independent position and its freedom from any kind of Government control. But we have nothing against interdependence and we are glad to see that broadcasting organisations, whatever the nature of their character, are drawing closer together. The rapid expansion of television and radio makes this inevitable if we are to give our viewers and listeners the best possible service and keep them informed of events and trends in all parts of the world. Only by ever-increasing cooperation can we play our part in helping to foster greater understanding between peoples.

SIR HUGH GREENE, K.C.M.G., O.B.E.
Director-General of
The British Broadcasting Corporation



Karel Hoffmann

Czechoslovakia was among the first countries in Europe where radio was introduced. It also ranks among those European countries with the highest ratio of radio receivers per head of the population.

Television too has been developing at a very rapid rate, just as in the other advanced countries of the world. However, it should not be said that there is "competition" between the two, or that television is a danger. Each of the two media is seeking its own specific character and they are thus complementary.

A clarification of the radio's specific features and tasks has spurred the creative activity of radio staffs and all through the programme there is noticeable a creative flux which has found its expression in new types of programmes hallmarked first of all by a deeply human understanding of all the problems of modern man.

Czechoslovak Radio has millions of grateful and highly demanding listeners. It values their trust, listens carefully to their opinions as they are expressed in thousands and thousands of letters and is doing its best to utilise their suggestions in actual programme work. Through its foreign language broadcasts Radio Prague contacts listeners in a number of European and overseas countries. All the broadcasts of Czechoslovak Radio, whether home or foreign programmes, have one overriding aim: to make a contribution to better understanding among the world's nations and to extend their knowledge of each other. An important feature in this work is the steadily increasing cooperation with radio stations of all continents which makes possible a wide exchange of radio programmes and authors. In all this the WRTH is a very valuable aid. Czechoslovak Radio is determined, through all its resources, to serve the cause of progress, friendship and peace. The very useful Handbook which has given itself the same aim is to be wished full success.

KAREL HOFFMANN
Director General, Czechoslovak Radio

HOW TO USE THE WORLD RADIO TELEVISION HANDBOOK

The World Radio Television Handbook is designed to help the international radio listener obtain maximum enjoyment from his receiver.

The first section of the Handbook contains instructive articles relating to broadcasting, information regarding broadcasting and television organizations, and popular technical articles and tables of practical value to listeners.

The main section of the book (pages 00—00) contains detailed information, by country, of the **Radio Stations** and broadcasting organizations of every country in the world, including names and addresses of broadcasting companies, names and titles of leading officials, lists of broadcasting stations in each country, including frequencies, wavelengths, transmitter power, call signs (if used), and station names. Program information is also listed, including times, frequencies, and beam areas of the broadcasts in each language. The announced **location** of the st., rel. st's exc., is usually the studio and administrative location, since the tr's are often located in outlying areas.—**Power** is stated in kilowatt (kW) or Watt (W). When two powers are listed, the figures represent the lower and upper limits of power, where a station uses more than one tr. on the frequency at different times (s.w.) or varies the power of the tr. for day and night operation (m.w.).

A **listing by frequency and wavelength** of the shortwave stations of the world, and long and medium wave stations of Europe, North Africa, Near East is presented in the last part of the Handbook, for use in facilitating the identification of stations.

Abbreviations: See page 00 for explanation.

Short-wave stations may be used either for domestic broadcasting to listeners in the same country or for international broadcasting directed to listeners in other countries.

International short-wave stations usually employ directional antennas to beam their programs to particular areas on frequencies calculated for best reception. Most international broadcasts are scheduled for the evening hours in the intended reception area, but some are in the morning or at other times during the day. The reception areas give their names to the services: European Service, Far Eastern Service, North American Service, etc. Languages employed are those of the listeners in the area to which the broadcast is directed, also the language of the transmitting country for reception by persons understanding that language.

Best reception is usually obtained from transmissions directed to your area. However, there is a considerable amount of overlapping between many service areas and, therefore, it is often possible to obtain good reception of programs beamed to adjacent areas, and sometimes, even of programs directed to distant parts of the world. Shortwave propagation conditions change continually because of the influence of daylight and darkness, seasonal effects and solar activity. Consequently, good reception requires frequency change from time to time.

Domestic short-wave stations are usually of lower power than international stations, and generally use non-directional or wide beam antennas, in order to reach local or national audiences. These stations make fewer seasonal frequency changes, and many operate on the same channel for both day and night operation. The stations are utilized to reach areas of a country where coverage by medium and long wave stations is not adequate.

Long and Medium wave stations are used mainly for transmitting programs to listeners in the country in which the stations are located. These stations vary from powerful transmitters capable of being heard throughout the country to low power stations intended only for a small area in the vicinity of the transmitter.

FM (Frequency Modulation) Stations operate on very high frequencies (VHF); ranges of 88-108 Mc in the Americas and 87-100 Mc in other areas, and provide interference-free reception over a short radius. Most FM stations relay programs of a medium or long wave station.

Frequency and Wavelength — Frequencies are measured in kilocycles per second (kc/s) and megacycles per second (Mc/s). A kilocycle is 1000 cycles. A megacycles is 1000 kilocycles. Wavelengths are measured in meters.

A formula between frequency and wavelength is as follows: Frequency (kc/s) $\times$ Wavelength (m) = 300000. Wavelength (m) $= \frac{300000}{\text{Frequency (kc/s)}}$ and Frequency (kc/s) $= \frac{300000}{\text{Wavelength (m)}}$.

Due to the propagational conditions, interference by other stations, jamming, malfunction of transmitter, reallocation of frequencies by a country or convention, or for some other reason, stations may use frequencies which are at variance with the frequency(ies) indicated in this handbook.

Program times used in the listings are based on the 24 hour clock. Midnight is 00.00 hours, 3 a.m. is 03.00 hours, 9 a.m. is 09.00 hours, and midday is 12.00 hours. Then, instead of starting another 12 hour cycle (p.m.), under the 24 hour system the hours increase until midnight. Thus 3 p.m. is 15.00 hours, 10 p.m. is 22.00 hours, and so on until 23.59 (11.59 p.m.) is reached and a new 24-hour cycle starts. This system eliminates any confusion between times a.m. and p.m.

Time Conversion: All programs are listed in GMT (Greenwich Mean Time). To convert from GMT to your local time, refer to the World Time Table on page 00 to determine how many hours your time is ahead or behind GMT, and add or subtract that amount in order to convert to your clock time. For quick conversion, it is useful to write the GMT hours, 00 to 24, down on one side of a sheet of paper, and then enter the correct local time opposite each GMT hour. Summer time or Daylight Saving time, adds an hour to local time, so this should be taken into account in countries where it is utilized.

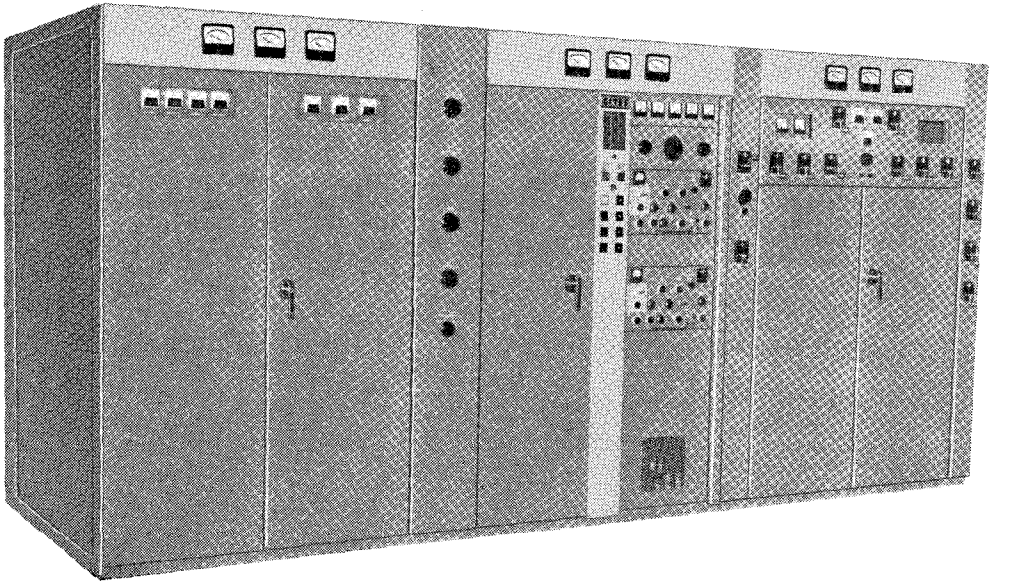
Program schedules: The program schedules of many countries are divided into Home Services and Foreign Services. The Home Service programs are arranged by language and by program services or networks. The Foreign Service transmissions are generally arranged by beam area, and by language for each beam area. The times and frequencies of the programs in each language are listed together, in order to facilitate the determination of the times and frequencies of the broadcasts in each language. The times of news broadcasts and other program features are also included.

Therefore, if you wish to hear a broadcast in a particular language from a country, refer to the listing for that country of the time and frequency of broadcasts in that language. Most broadcasts are transmitted on more than one frequency, so try the various frequencies listed, to determine which one is received best at your location.

This field-proven 100 kilowatt HF broadcast transmitter, Model HF-100, will provide unquestionable reliability under extreme environmental conditions with an operating economy second to none for service in the international shortwave broadcast band.

Employing high level modulation, the HF-100 features a straightforward design with front panel tuning and only six major different tube types. It is completely air cooled, and for added dependability includes silicon rectifiers in the high voltage power supplies. Extra long life is also assured through intercubicle wiring and oversized components.

Thousands of Gates transmitters, including the HF-100 Model, are operating in more than 75 countries around the world. When planning to install, enlarge or improve your broadcast facilities, it will pay you to consult Gates. Transmitters are available in all powers from 100 watts to 100,000 watts.



More High Powered Broadcast Transmitters Are Bought From Gates Than From Any Other Manufacturer

Gates' HF-100 100,000 Watt HF Broadcast Transmitter Is One Reason Why

HOW TO USE *(continued from page 10)*

Identification of Stations: Most stations in Europe, Middle East, Africa and Asia identify by announcing their station name and location. Most stations in North America and Pacific (incl. Australia/New Zealand) identify by the use of a call sign of three to five letters or a combination of letters and figures, of which the first, or first two, denote the nationality in accordance with the international list of prefixes. Most stations in Latin America use a call sign (sometimes not frequently announced), a station name, and location.

In addition, many stations use musical interval signals at sign on and between programs, in order to help listeners to find the station on their dial and identify it as the desired station. These interval signals are included in the country listings.

How to Identify a Station by Frequency or Wavelength: When you hear a station that is unknown to you, first try to determine some clue to its identity by attempting to determine the language, noting the type of program, etc. Then, note the approximate frequency or wavelength indicated on your dial, and turn to the table "Short-wave Stations of the World" in the back of the Handbook, and ascertain what stations operate in that vicinity. Next, check the program listings to determine which of the stations are scheduled to operate at that time of day, and which are most likely to be audible at your location, depending on the power and distance away. For definite confirmation, it is desirable to wait for station announcement or interval signal.

Frequency Changes: The frequencies listed are those which were scheduled for use at the time of publication. However, due to a number of reasons, including interference and changes in propagation conditions, it may be necessary for a country to make frequency changes. Often only one of the frequencies on a program will be changed, so the new frequency can be determined by tuning in the other frequencies and listening for the announcement of the frequencies being used. Reference to a publication listing the latest frequency changes for the International Stations: the **Summer-Supplement to the WRTH** (published by mid June each year) or a monthly short-wave listeners publication issued in your country, is also helpful.

Interference: Due to the present crowded condition of the medium and short wave broadcasting bands, interference may be encountered from other stations operating on the same or closely adjacent frequency. In addition to interference from other broadcast stations, there may also be interference from "jammers", which transmit a variety of noises in an attempt to prevent certain foreign broadcasts from being heard in the country operating the jammers. When interference is encountered, try another of the listed or announced frequencies, if several are in use, or try a broadcast at another time. See also article "Interferences" page 00.

Reception from Hard-to-Hear Countries: If you wish to hear a station or program from a particular country, refer to the listing from that country, determining first whether it has any broadcasts beamed towards your area or adjacent areas, if not, refer to the frequency, time and power listing to determine where and when reception might be possible. Also, note the bands and times when stations in other countries in that part of the world are audible. It is possible to hear many far distant stations, even if they do not beam programs to your area, by listening when the propagation and clearness of channel conditions are favorable.

Verification by QSL-cards: As indicated in the program listings for the various countries, many stations are interested in receiving reports from listeners about their transmissions. These stations acknowledge reports by sending listeners a QSL card (verification) or letter. Most **international** broadcasting stations do not require enclosure of return postage and will reply with a QSL card or letter. **Domestic** broadcasting stations do not normally request reports from foreign listeners, so return postage should be sent with reports to these stations. Return postage should be sent in the form of an International Reply Coupon (IRC), obtainable at post offices in most countries. Reports should be sent to the station address given in the country listings. They can be written in English in most cases, but Spanish is preferred by South and Central American stations.

Reception reports are useful to radio engineers in selecting the most suitable frequencies for broadcasts beamed to your area. Reports are preferred in the SINPO code, which is as follow:

S (Signal Strength)	I (Interference)	N (Noise)	P (Propagation Disturb.	O (Overall Merit)
5 excellent	5 nil	5 nil	5 nil	5 excellent
4 good	4 slight	4 slight	4 slight	4 good
3 fair	3 moderate	3 moderate	3 moderate	3 fair
2 poor	2 severe	2 severe	2 severe	2 poor
1 barely aud.	1 extreme	1 extreme	1 extreme	1 unusable

Information about **Television Stations** is provided in the section following the sound radio section, including names and addresses of Television companies, location, power and channel of Television stations, and program schedules of these stations.

With reference to the first Television page we give a short explanation of some of the technical words and figures mentioned — The announced **location** of the station is usually the studio location, since most TV tr's are situated upon the highest location in the area in order to obtain more widespread coverage—Two systems of **modulation** are used to transmit the audio signal of the TV st's either frequency modulation (FM) or amplitude modulation (AM). All video transmissions are normally amplitude modulated — **Polarization** signals are horizontally polarized (H) or are vertically polarized (V). Polarization is usually selected according to the need for a reduction of interference with other stations, or to obtain engineering standards required by the government of the country in which the st. is located—The **band width** is shown in Mc and represents the limits within which both the video and audio tr. are contained—**Number of lines** transmitted express the number necessary to form one complete frame or picture, and **frames** state the number of times per second the picture area is completely scanned—**Video and Audio Power** is indicated in kilowatt (kW) or Watt (W). In the most cases the figures denote the effective radiated power (ERP) due to the stations antenna system—**Video and Audio frequency** is stated in Mc per sec. The relationship between the quoted figures and the limits of the video band varies among countries and can be determined by reference to the standards of the systems used by the resp. countries.

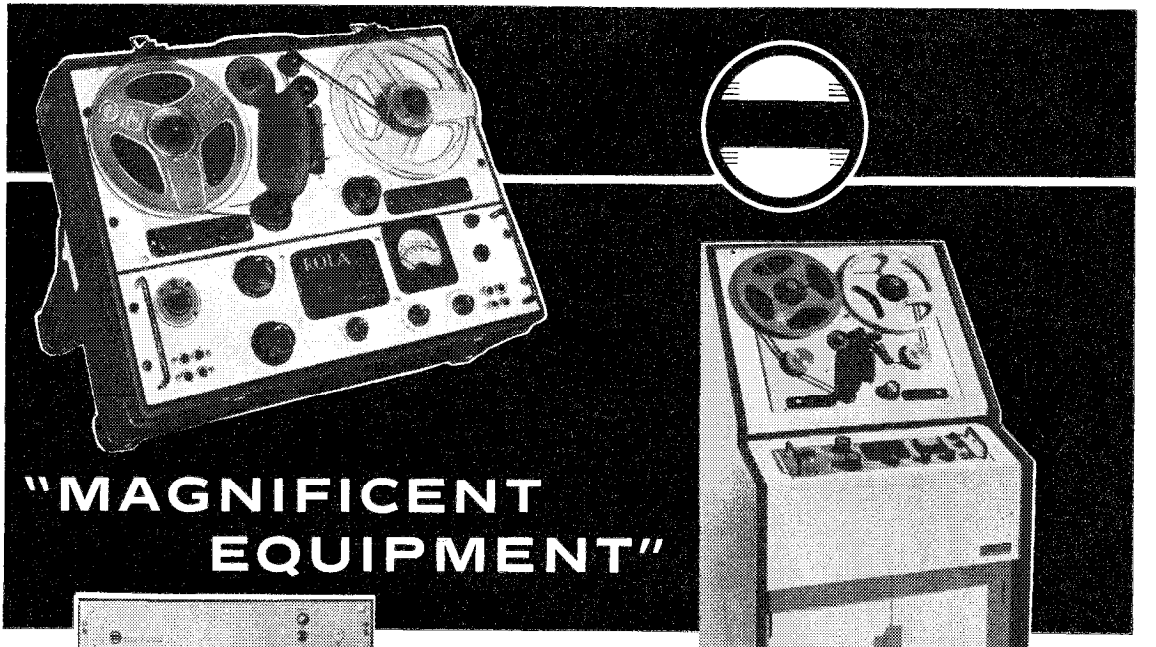
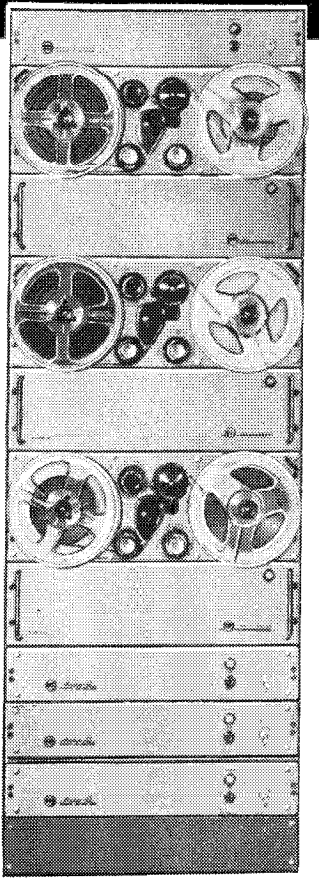
AIR is an association of the broadcasting corporations of the American countries. Founded in 1946 it represents more than 5000 broadcasting and 400 television stations. Its purpose is to preserve free and stable broadcasting, promote cooperation between broadcasting corporations and the public authorities, to raise the cultural level of the peoples, to work for the preservation of freedom of utterance and instruction and a closer feeling of association between the private broadcasting corporations on the American Conti-





Top Left: ROLA Model 77 Mk. III Portable Recorder. Right: ROLA 777 Studio Console. Left: ROLA Auto Station for Automatic Tape Programming.

For the past 10 years ROLA Professional Quality Tape Recorders have been standard equipment for the Australian Post Office and for most of the Commonwealth's 110 Commercial Broadcasting Stations. They are also widely used in New Zealand, India and South East Asia. This is not surprising for these individually handcrafted ROLA recorders have been designed to combine outstanding Record/Replay characteristics with complete operating flexibility and long term reliability of operation. The ROLA range includes Studio Consoles, Portable Recorders and equipment for Automatic Programming.

ASIAN BROADCASTING UNION

The Fifth Asian Broadcasting Conference was held in Seoul, Rep. of Korea from 1st to 5th October 1963. The representatives of the National Broadc. Organization in Australia, Rep. of China, India, Japan, Rep. of Korea, New Zealand, Pakistan, Philippines, United Arab Rep. and Vietnam resolved to recommend to their respective authorities the establishment of the Asian Broadcasting Union (ABU) and to adopt as constitution **Statutes of the Asian Broadcasting Union.**
The ABU headquarter is established in Tokyo. In the interim between the conclusion of the fifth conference and the first conference of ABU in 1964 NHK has offered to set up a provisional secretariat with Ichiro Matsui, Man. Dir. of Overseas Broadc. Dept. NHK as Acting Secretary General.
Because the medium frequency band is extremely congested and several countries of the Asian and Pacific region are having difficulty in securing such channels, it was resolved that a study group with membership: ABC, AIR, BCC, KBS, NHK (Chairman), NZBC, UARBC be appointed with the aim of examining by correspondence technical problems regarding the most effective use of the frequency spectrum for m.w. broadcasting; and that this study group should meet immediately before the next Conference to prepare a report for the Engineering Committee of that Conference.
The Conference resolved to accept with gratitude and appreciation the kind invitation of the ABC to hold the First A.B.U. Conference in Sydney.

AFRICAN RADIO TELEVISION UNION (URTNA)

URTNA is a Union of National Broadcasting Organizations of all independent Africa, its aims, under article 2 of its statutes are: – "The U.R.T.N.A. has no commercial aims. Its objects are: –

(a) To support in every field the interests of those African organisations operating radio and or television services that have accepted the present statutes and to establish relations with other international organisations.
(b) to promote and coordinate the study of all questions relating to broadcasting and to secure the exchange of information on all matters of general interest to those radio and or television services.
(c) to take all possible steps designed to assist the development of African radio and television in all its forms.
to seek within the framework of African co-operation, the solution to any differences that may arise between members.
(e) to use its good offices to ensure respect by all members for the provisions of international and inter-African agreements relating to all aspects of radio and television."

The Union headquarters is at the moment in Dakar and its Technical Centre at Bamako – The Pres. of the Union is Mr. W. F.Coleman, Ghana; Vice-Pres. M. Messaoudi Zitouni, Algeria. The Director of the Administrative Centre at the headquarters is Mr. H. Younes. Members of the Administrative Council of the Union are Ghanz, Algeria, Senegal, Mali, Cameroun, Ivory Coast, Guinea, Nigeria and Ethiopia – The Headquarters address of the Union is U.R.T.N.A, 15, Boulevard de la Republique, Dakar, Senegal.

UNIVERSITE RADIOPHONIQUE ET TELEVISUELLE INTERNATIONALE (U.R.I.)

Founded by R.T.F. 1949.
Addr: 116, Ave. du President Kennedy, Paris 16°, France.
The Standing Committee of the International Radio-Television University (URI) meets twice a year in Paris between sessions of the General Assembly which are held every two years. This Committee provides continuity in the running of the URI.
This Committee comprised Mr. Théo Fleischman, president.
Radio Commission: Mr. René Dovaz, Hon. director of Radio Geneva; Mr. Gian Franco Zaffrani, Secr. Gen. & Dir. of International Relations, Radiotelevisione Italiana; Dr. Henning Wicht, Dir. of Prgr's, Hessischer Rundfunk; Mr. André Payette, permanent delegate of R. Canada in Paris.
Television Commission: Mr. Sergio Pugliese, Dir. of Italian TV; Mr. Nic Bal, Dir. of Cultural Prgr's of Flemish TV; Mr. Peter Bokor, Dir. of Prgr's of the Hungarian TV.
France: Mr. Pierre de Boisdeffre, Dir. de la Radio à O.R.T.F; Mr. Michel Robida, Deputy Dir. of International Relations O.R.T.F, Mr. Armand Lanoux, Secr. General of U.R.I.
43 countries have joined the work of URI.

COMMONWEALTH BROADCASTING CONFERENCE

Members: the national public service broadcasting organizations which are responsible for the planning and presentation of the broadcast programmes of independent Commonwealth countries.
The Fifth Conference, held in Canada in May/June 1963 was attended by the chief executives and others from the following organizations: All India Radio, Australian Broadcasting Commission, British Broadcasting Corporation, Canadian Broadcasting Corporation, Cyprus Broadcasting Corporation, Ghana Broadcasting Corporation, Jamaica Broadcasting Corporation, New Zealand Broadcasting Corporation, Nigerian Broadcasting Corporation, Radio Ceylon, Radio Malaya, Radio Pakistan, Sierra Leone Broadcasting Service and Tanganyika Broadcasting Corporation.
The Conference, acknowledging the mutual benefit of the Commonwealth conception and links in radio and television broadcasting as in other fields, examined means of increasing programme interchange between member organizations and of providing mutual assistance in the training of staff. Agreeing on the importance and necessity of the free flow of information, members undertook, in the interests of promoting greater ease in newsgathering and reporting, to use their influence with the authorities concerned to seek removal of restrictions on the export of undeveloped film and of duties on tape and film recordings, and the elimination of delays in customs clearance of film cameras, sound recorders etc. The Conference reaffirmed its conviction that broadcasting is a public trust, and discussed aspects of educational, rural and multilingual programming with special reference to the social and economic needs of developing countries. Engineering and technical matters, covering all aspects of broadcasting, were discussed by a special committee; and a further sub-committee examined copyright and other legal problems affecting broadcasting as a whole.
The decision was taken to establish a Conference Secretariat in London, on an experimental basis, to facilitate continuity between Conference meetings in the interchange of information in the fields of programming, administration and engineering.
The Sixth Conference will meet in Nigeria in September 1965.
Secretariat address: Broadcasting House, London W.1.

A MESSAGE FROM THE EDITOR

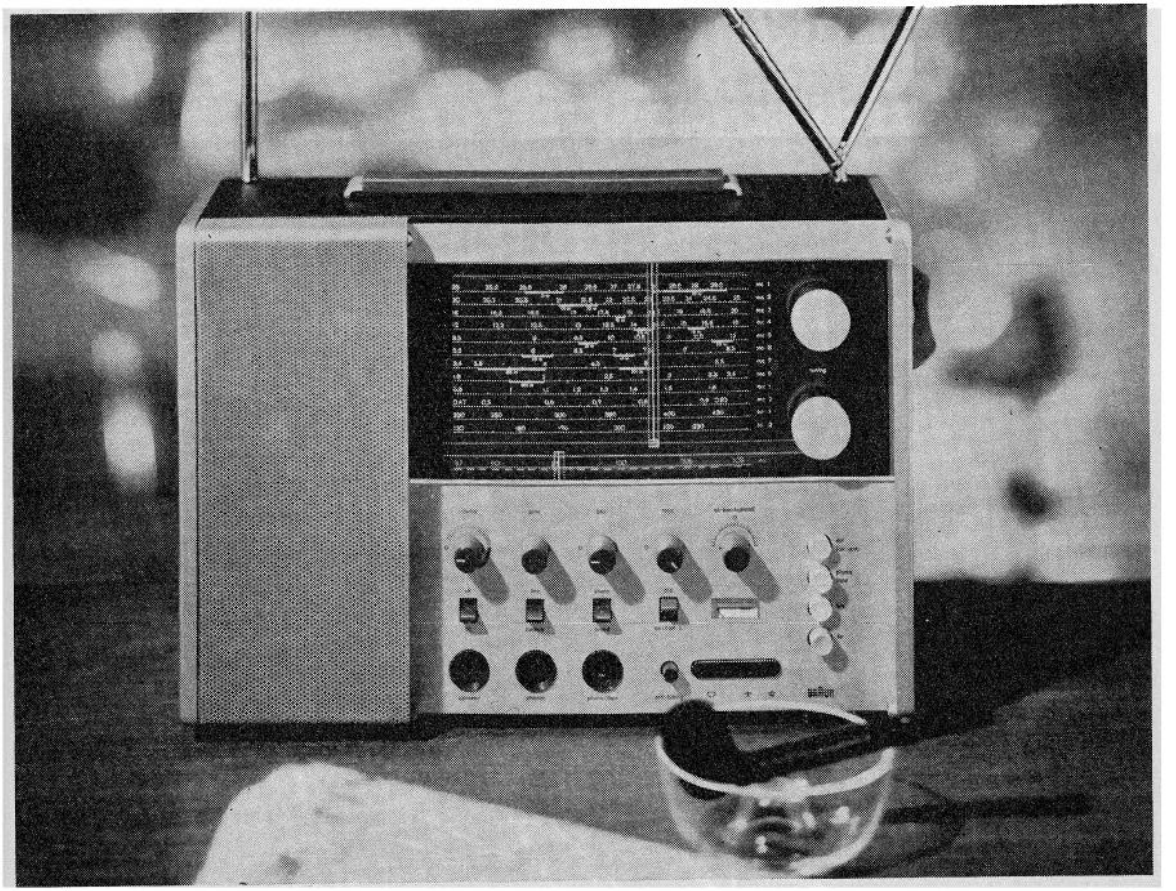
This is the nineteenth edition of the World Radio Television Handbook in which we have attached importance to giving as much practical information as possible to short wave listeners in order to make it easier and quicker for them to pick up the broadcasts of the various countries and to identify the stations.

We have three wishes to advance: the one is to help us by making WRTH as well-known as possible in all circles interested in radio and television in general and in *short wave listening in particular;* the other is to receive your criticism and wishes in regard to the contents of the 1965 edition.

To radio and television stations we direct an earnest appeal to send us *regularly* all corrections and particulars of extensions, which will then be passed on for the benefit of listeners all over the world.

Thanks are due to all those who have assisted in various ways in the preparation of this edition – to all broadcasting and television organisations irrespective of politics, race or religion – to radio clubs and contributors in many countries all over the world, and to our many faithful advertisers.

J. M. FROST



Universal All Band Radio

The T1000 is a universal radio and heterodyne receiver. Its 13 wave bands cover nearly all frequencies currently used for broadcasting throughout the world: Commercial and amateur, citizens bands and telegraphy, maritime and aeronautical broadcasts.

On FM the sensivity, selectivity, and noise suppression factors of the T1000 were pushed to the highest limits.
The short wave section is particularly well developed. Spread over eight bands, it permits the entire short-wave range from 1.6 to 30 mc to be received. Large, easy-to-read dials provide easy tuning. The instrument's bandspread affords precise station selection. A drum-type band selector with high repeat-exactness permits even weak stations to be quickly retuned.

The instrument's input sensivity reaches or surpasses that of commercial receivers. Automatic volume control (AVC) works on three stages. It is defeatable for direction finding purposes. In this case the desired sensivity may be set manually.

T1000

The T1000's selectivity is outstanding, its image rejection excellent. Broad or narrow bandwidth are switch selected. A beat frequency osciliator permits heterodyne reception.

The instrument operates on built-in mono cells (plus a separate one for the dial lighting), on a power pack of 6, 12, or 24 volts DC, or on 110/220 volts AC.

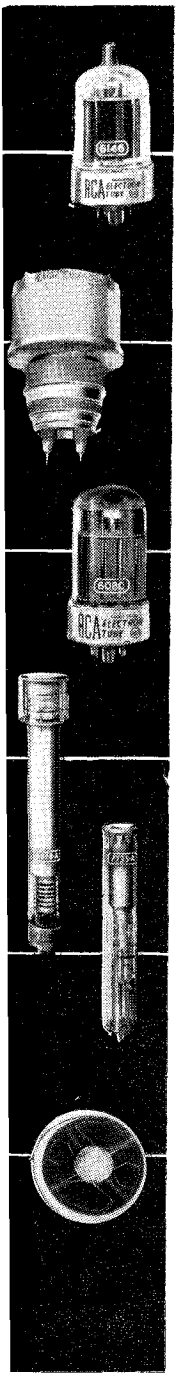
THE CHOICE OF BROADCASTERS EVERYWHERE...

RCA BROADCAST TUBES FOR LONG

LIFE, OPTIMUM PERFORMANCE



Whether you concern yourself only with audio, or with audio-visual applications, there's an RCA Power Tube or Imaging device for every broadcast need. RCA-devised techniques developed for space-age applications are being employed to advantage in all RCA Tubes to optimize their usefulness in broadcasting.

SMALL POWER TUBES. Shown is RCA-6146, a typical example of an RCA Beam Power Tube. It is part of a line of small power tubes for design and replacement in transmitter applications for CW, AM, or SSB. The RCA line, including both glass and ceramic-metal types, offers a wide choice of input and output ratings for use over a wide frequency range. Other popular small power tube types are: RCA-807, -813, and 866A.

LARGE POWER TUBES. Shown is RCA-6166A/7007. Continuing search for tube betterment has increased the life expectancy and improved the performance of RCA-6166A/7007, an example of design and performance available in a wide choice of broadcast tubes for audio and video service at VHF and UHF.

INDUSTRIAL RECEIVING TUBES. Shown is the RCA-6080. Numerous designs offering operating efficiency, high reliability, compactness, and long life are available for new designs or direct replacement.

IMAGE ORTHICONS. Shown is the RCA-5820A, typical of the RCA Image Orthicon line whose performance rivals that of any on the market today. For color and black-and-white pickup—studio or outdoor—you can always be sure of improved background uniformity, higher signal output levels, higher signal to noise ratio, reduced microphonics, and improved sensitivity. Other popular types: RCA-7293A and -7295A.

VIDICONS. Shown is RCA-7735A. RCA has vidicons for every TV application. In the industry's broadest line of types, you can find a size, sensitivity, and range of electrical characteristics to meet color and black-and-white TV pickup requirements exactly. Custom types, too.

MAGNETIC RECORDING TAPE. You get Red Seal quality sound in RCA's scientifically-processed magnetic tape, available in lengths and thicknesses and base materials to suit your professional recording needs. Available for home use as well.

Additional information on these products is available through your local RCA Distributor. For technical bulletins on Power Tubes, Vidicons and Orthicons, write to: Advertising Department, RCA International Division, Section 200, Clark, New Jersey, U.S.A.

EUROVISION IN 1964

By J. Treeby Dickinson, Chief Engineer, Technical Centre of the E.B.U.

1964 has indeed been a noteworthy year for Eurovision, the international television exchanges effected by the broadcasting organisations that are Members of the European Broadcasting Union. The year began with the Winter Olympic Games in Austria, on 6th June the E.B.U. celebrated the Tenth Anniversary of Eurovision, on 8th April there was a demonstration of the transmission of colour television over the Eurovision Network and during October the Olympic Games in Japan provided the occasion for the largest scale, most complicated and certainly the most costly operation yet undertaken within the Eurovision framework. In addition, there were the usual annual events such as the Eurovision Song Contest, held this year in København, with 21 Members participating, the programme being broadcast in 18 countries.

Ten years of Eurovision

Eurovision officially came into existence on 6th June, 1954, the first day of the "Lille Experiment", which comprised daily transmissions of different kinds over a temporary television network linking Belgium, Denmark, France, Germany, Italy, the Netherlands, Switzerland and the United Kingdom, the object being to prove the procedure that had been worked out for handling international television relays. The operation was so called because it was directed from a temporary Coordination Centre at Lille (France), kindly provided by the R.T.F. (now the O.R.T.F.), that place having been chosen because it provided easy monitoring of 405-line signals from Britain and 819-line signals from France, as well as the 625-line signals utilised in the other countries. The enthusiastic response of the public and Press to the programmes transmitted during the four weeks of the experiment was such that the broadcasting organisations concerned had no hesitation in embarking on schemes for undertaking such exchanges on a routine basis—one of these schemes was the construction and equipment of the permanent Coordination Centre in Brussels, which was taken into service in December, 1955. Almost immediately afterwards, the first large-scale operation was undertaken : the Winter Olympic Games from Cortina d'Ampezzo in January, 1956. Another innovation was introduced in December, 1957 : the first multiple-origin programme, broadcast simultaneously by nearly all the connected television services.

In the early years, most of the programmes exchanged had been of sporting events and public ceremonies, but slowly the proportion of news-items and topical transmissions increased. All television services illustrate their domestic news bulletins with short film sequences made on the spot during the day, and it was realised at an early date that, if all their films could be pooled, the E.B.U. Members would have at their disposal an unequalled source of news-pictures. The problem was to deliver the film in time for broadcasting the same evening, and attention naturally turned to the Eurovision Network. Service-trials lasting a few weeks of what became known as the Daily News-Exchange Scheme were held in October, 1958 and May, 1959 and although they were most successful, the scheme was considered too costly.

July, 1960 was notable in the history of Eurovision for the coverage of the Olympic Games in Rome, which gave rise to transmissions of unprecedented complexity.

Throughout these years, the Eurovision Network had also been growing in extent, as well as in density. To the eight countries that had been connected at the beginning, three more had been added in 1956, one in 1958, two each in 1959 and 1960, and one each in 1961 and 1963. At the same time, more vision circuits were becoming available, so that programmes could be transited across countries without interference with their national television facilities, and alternative routes were available for simultaneous programmes. However, all the international circuits were being rented by the minute for each transmission, and it was clear that operational convenience and technical reliability could be greatly improved if these circuits were permanently at the disposal of the E.B.U. A committee was appointed within the E.B.U. to advise the Administrative Council how a permanent Eurovision Network might be achieved, and as a result Stage 1 of the Permanent Network Scheme was put into effect on 1st January, 1962. Stage 1 comprises programme-sound and communication circuits, but Stage 2, comprising the vision circuits, is being held in suspense pending the negotiation of economic long-term rentals. Nevertheless, Stage 1 has made it possible to obtain many practical advantages and, since it has been in effect, traffic has increased at a very encouraging rate. It has also made it possible to put into effect the Daily News-Exchange Scheme, and the transmission of short news-items is becoming a major activity.

The first intercontinental television relay took place in July, 1958, between Europe and Africa, the signals being relayed from an aircraft circling over the Mediterranean Sea, but this achievement was overshadowed in July, 1962, when multiple-origin live television programmes were relayed across the Atlantic Ocean by means of the experimental communication satellite "Telstar I". Since then, transatlantic transmissions have become a commonplace, and early in 1964 the first television transmission between Asia (Japan) and Europe was effected.

Significant events for Eurovision in 1964

Undoubtedly, 1964 will figure in the annals of Eurovision as the year of the Olympic Games. First came the Winter Games at Innsbruck, Austria, necessitating a very complex television organisation because of their widespread interest throughout the world. During the twelve days of the Games, nearly two hundred programmes were distributed over the Eurovision Network for E.B.U. Members, more than thirteen of which participated in each transmission. In addition the American Broadcasting Company undertook the production of television programmes for the United States and most of these were transmitted over the Eurovision Network to Frankfurt-am-Main for recording, the tapes being then immediately flown to America; other American items were transmitted to Paris or London for retransmission to the United States by satellite. In order to handle this heavy international commitment, the Oesterreichischer Rundfunk constructed a special Master Control Room for the E.B.U. at Innsbruck.

Although the number of television transmissions originating at the Tokyo Olympic Games, which

Rai Radiotelevisione Italiana

EUROVISION IN 1964

Continued from page 20.

The television tape-recording facilities in the technical area put at the disposal of the E.B.U. in the N.H.K. Broadcasting Centre in Tokyo. In the centre, wearing a dark suit, is Dr. Aldo Riccomi, who was responsible for all the E.B.U.'s television technical operations in Japan in connection with the Olympic Games.

lasted from 10th to 24th October, 1964, and distributed in Europe for E.B.U. Members was considerably less than the corresponding figure for the Winter Games at Innsbruck, the complexity and the cost of the operation were proportionately immensely greater, because of the great distance between Japan and Europe.

Two main methods of obtaining television pictures from Japan were adopted. The first consisted of tape-recording the pictures of the Games distributed over the Nippon Hoso Kyokai network and flying the tapes to Europe. This method is not nearly as simple as it sounds; the main complications were the fact that the Japanese television uses a 525-line, 60-field standard, numerous synchronous commentaries in different languages were required by the E.B.U. Members, the times of departure of the air-liners left insufficient time to edit the tapes in Tokyo and there was a risk in October that the aircraft would, because of weather conditions, be diverted to other airports in Europe. The decision was taken to record the pictures and sound effects on the television tape, and ten-channel audio tape-recorders, with special synchronising facilities, were designed and constructed for use in Tokyo and Europe for the commentaries. Arrangements were made with the N.H.K. for the provision of a separate Control Room in Tokyo for the E.B.U. and the video and audio tape-machines and the ancillary equipment were installed there. In Europe, Hamburg was selected as the point of reception of the tapes flown from Tokyo and technical arrangements were made for converting the pictures at Hamburg from 525 to 625 lines and for distributing them to all E.B.U. Members using that standard; separate transmission of unconverted 525-line pictures to Paris and London was arranged, for local conversion to 819 and 405 lines. The audio tapes were replayed at Hamburg and the ten commentaries, synchronised with the pictures, distributed in the same way as for an ordinary multilateral transmission from Hamburg. However, it was necessary to make provision for the diversion of the aircraft, and it was considered that in that case the aircraft would probably land either in København or at Frankfurt-am-Main, so emergency facilities for replaying the tapes were provided in København and Wiesbaden, although the 525-line signals still had to be routed to Hamburg for conversion. If the aircraft had to land elsewhere, it would be necessary to convey the tapes by any available method to one of the three places where replay facilities were available.

About two months before the beginning of the Tokyo Games, it was confirmed that the "stationary" satellite Syncom III would be in a position to transmit television signals from Japan to the west coast of the United States during the Olympic Games. This opened up new possibilities, because, whereas the method described above made it possible to show Tokyo pictures in Europe during the early evening of the day after the events, it was possible by using Syncom III to show the picture in the late evening of the same day. To do this, it was necessary to transmit the pictures received on the west coast of the United States across Canada to Montreal, where they were recorded on tape. The tapes were loaded into a jet aircraft chartered by the E.B.U. and immediately flown to Hamburg, for distribution as in the case of the tapes flown from Tokyo direct. However, the satellite facility made no provision for multiple commentaries and these were transmitted sequentially over four telephone circuits from Tokyo to Hamburg, where they were rerecorded, during the time taken for the chartered aircraft to fly the Atlantic Ocean. Arrangements were also made for edited recordings of particularly important events to be transmitted from Montreal to Andover (Maine) for immediate transmission to Europe by the satellite Relay I when a pass occurred at a convenient time, although it was no longer officially available.

The arrangements for conveying vision and sound tapes by air from Tokyo to Europe worked very well in practice, although on seven of the fifteen days the air-liner arrived late; on two occasions, because of diversions, the tapes had to be replayed in København instead of Hamburg, and on two other occasions at Wiesbaden. The signals were distributed over the Eurovision Network to never fewer than twenty-one television services within the E.B.U. and to two O.I.R.T. members. Provision had been made also to fly to Europe, with the E.B.U. recordings, tapes made specially for individual services, the signals being fed over the Network to the services in question after the E.B.U. material.

As far as the pictures were concerned, the transmission by the satellite Syncom III was highly successful. Unfortunately, on the sixth day, the submarine telephone cable between Japan and Honolulu, upon which the E.B.U. was relying for transmitting the commentaries in the various languages, broke down. It was restored four days before the end of the Games, but in the meantime considerable difficulty had been experienced with the sound; the only alternative, the long-distance radiotelephone circuits, were already almost fully allocated to press and sound-broadcasting traffic, and in any case their technical quailty is inferior. However, a total of nearly thirteen hours of programme was transmitted by way of Syncom III and the aircraft chartered by the E.B.U. to fly the tapes daily from Montreal to Europe, where the signals were distributed over the Network to twenty-two E.B.U. services and four O.I.R.T. services. The satellite Relay I was made available on six occasions for transmitting to Europe shortened versions of the programmes received by way of Syncom III.

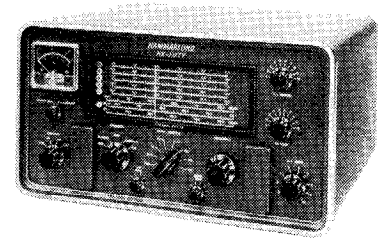
HAMMARLUND

WORLD LEADER IN COMMUNICATION EQUIPMENT

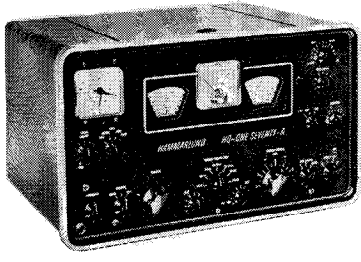
Fabulous HX-50 TRANSMITTER

A superb New Transmitter that obliterates old concepts of performance and value. Conservatively rated at 130 Watts TWO-TONE P.E.P. and CW input. Covers all amateur bands 80 to 10 meters and provides a 160 meter facility. Features: VOX and push-to-talk circuitry. 5-position switch for internal or external VFO plus 3 crystal-controlled frequencies for fixed operation. 3-element Pi network variable output circuit. Carrier suppression 50DB, unwanted sideband 40DB, I. M. –35DB min. Built-in antenna changeover relay, VOX and break-in keying. VFO and exciter stages, gang tuned for quick tuning.

COMPACT FILTER TYPE



HQ-170A RECEIVER



THE SINGLE SIDEBAND SPECIALIST
NEW AND EXCITING TRIPLE CONVERSION

The radically improved HQ-170A creates a new standard for amateur radio receivers. NEW features including significantly better electrical and mechanical stability, silicon rectifiers for cooler, high-efficiency operation, an accessory outlet and a system socket provide an unmatched degree of operating ease and performance. 17-tube superheterodyne circuit with automatic noise limiter. Full dial coverage of all bands between 6 and 160 meters plus 2-meter calibration.* (*VHF model soon available with direct tuning of 2 meter band!) Slot-Filter-razor sharp. 1.5 Kc/s at 6DB. 60 Kc/s IF gives 6-position variable selectivity with ± 3 Kc/s tuning.

PEAK POWER PERFORMANCE
to provide the hefty signal you have always wanted.

More talk-power when it really counts! At last a simply designed linear amplifier providing the kind of transmitter power you want. Ruggedly built to give a lifetime of service, the HXL-1 sets all new standards of performance in SSB, CW and AM operation. Complete coverage, 80 to 10 meters, efficient grounded-grid circuit using husky triodes, easily driven by an HX-50 or similar exciter. Power-packed for performance, conservatively rated at 1500W P. E. P., designed for 115/230 volt operation. A table-top powerhouse!

HXL-1 LINEAR AMPLIFIER
1500 WATT P. E. P. INPUT

THE WORLD OF RADIO BROADCASTING

By Roger Legge, U.S.A.

Broadcasting stations are assigned specified bands for operation, as follows:

LONG WAVE (Low Frequency)		MEDIUM WAVE (Medium Frequency)	
Kilocycles	Meters	Kilocycles	Meters
150–285	1053–2000	525–1605	187–571

SHORT WAVE
Tropical Broadcasting Bands

Kcs.	Megacycle Band	Meter Band
2300–2495	2	120
3200–3400	3	90
4750–5060	4	60

HIGH FREQUENCY BROADCASTING BANDS

Kcs.	Megacycle Band	Meter Band
3900– 4000	3,9	75
5950– 6200	6	49
7100– 7300	7	41
9500– 9775	9	31
11700–11975	11	25
15100–15450	15	19
17700–17900	17	16
21450–21750	21	13
25600–26100	25	11

Some broadcasting stations operate outside of the assigned bands, mainly near the edges of these bands.

The *Long Wave Band* (used in Europe) and the *Medium Wave Band* (used worldwide) are used mainly for domestic broadcasting, but are used also for some international broadcasting to adjacent countries. Although long and m. w. stations are normally heard only for moderate distances, long-distant reception is possible over dark transmission paths, mainly during the fall, winter and spring months in the reception area.

The *Tropical Broadcasting Bands* are assigned for use for *domestic* broadcasting in tropical areas, where high atmospheric noise levels limit the service area of medium wave stations. DX reception on these bands is best when the transmission path between the transmitter and receiver is all or mostly in darkness. These bands are used mainly by stations in Latin America, Africa, South and Southeast Asia, and Oceania.

The *High Frequency Broadcasting Bands*, between 3.9 and 26.1 megacycles, are used for both international and domestic broadcasting. These bands are allocated for worldwide use, except that the 3.9 and 7 mc. bands are not allocated for broadcasting in the American area. Also, the 3.90 to 3.95 mc. portion of the 75 meter bands is used only in Asia and Oceania.

Reception conditions on these bands vary according to the time of day and season of the year. Most of the international broadcasting stations make seasonal changes in frequency usage, mainly on the first Sunday of March, May, September and November. In addition, frequency and time changes are made at other times during the year, due to interference, change of program times, addition of new transmitters etc. A large percentage of the domestic broadcasting stations operating in the high frequency bands do not make seasonal frequency changes, but some, particularly the stations in India, Pakistan, USSR and South Africa do make seasonal shifts.

The *3, 6 and 7 mc. bands* are best for distant reception when the transmission path is all or mostly in darkness, and during fall to spring months in the reception area, when the local atmospheric noise level is lowest. Reception at any point is therefore best from the east from shortly before sunset until several hours before dawn, from the west between late evening and dawn, and from the north and south at any time during the night hours.

The *9 and 11 mc. bands* are best for long distant transmission on dark or partially dark paths, and for medium distances during daylight hours. In Europe and North America, night reception during the winter months is mainly from stations to the south during the present low phase of the sun spot cycle, since these bands are then too high for satisfactory east-west and west-east transmission.

The *15 and 17 mc. bands are*, in general, best during periods of daylight on the transmission path. However, night paths are open during the summer months, also north-south and south-north paths during the fall and spring.

The *21 and 25 mc. bands* are primarily daylight paths, and are best during winter months. There is practically no 25 mc. operation during the present low part of the solar activity cycle.

Shortwave Broadcasting Listening.

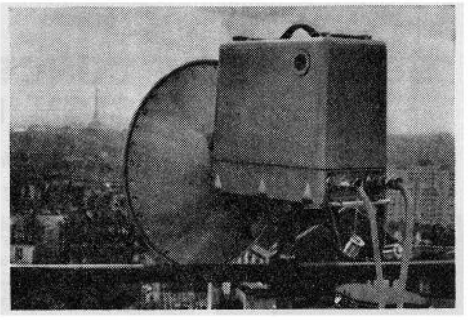
The first requirement for obtaining satisfactory reception of shortwave broadcasting stations is the availability of a suitable receiver. Receivers vary from small portable transistor sets to large communications type receivers. If you are purchasing a new receiver, the type to get will depend on the intended use and the amount which you are able or willing to spend.

Adequate band coverage is one of the primary requirements of a good receiver. Coverage of the 6, 7, 9, 11 and 15 mc. bands should be included, with the 17 and 21 mc. bands desirable but less necessary. If you live in a tropical area where local stations operate in the Tropical Broadcasting Bands, inclusion of the 3 and 4 mc. bands is also essential.

Good sensitivity and selectivity are needed in order to permit receiving desired stations with adequate strength and to separate them from other stations on closely adjacent frequencies. Since channels are spaced at 5 kc. intervals, good selectivity is essential in these days of crowded conditions on the broadcasting bands. The best way to determine whether a receiver has these characteristics is to try it out and observe the results obtained.

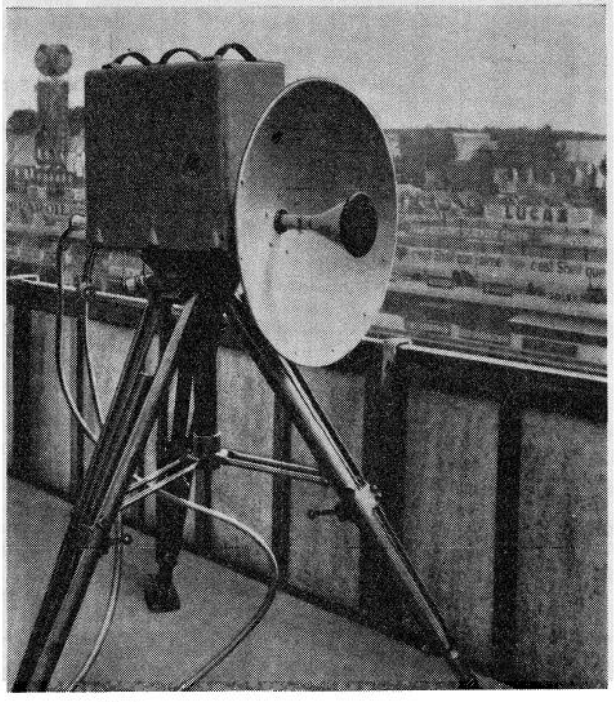
Band-spread is a further essential to look for in a receiver. Since there are from 40 to 70 five kc. channels in each of the short wave broadcasting bands, the spreading of each band over an adequate dial space is desirable, in order to facilitate locating stations on the dial, tuning them in properly, and retuning to a station on a latter date. Calibrated band-spread is best. Some sets have electrical band-spread, distributing a band over a separate dial, usually with a 1-100 scale, facilitating tuning of stations once the dial has been calibrated.

Televisions of : **FRANCE**
ENGLAND
SPAIN
YUGOSLAVIA
PERU



have adopted the mobile reporting microwave relay

TV 11



- 625 line TV signals (CCIR standard) either in black & white or colour, with or without the associate sound
- 819 line TV (French standard) with or without associate sound
- Industrial TV signals
- Several simultaneous high quality music channels
- Radar signals
- Telemetering or remote control signal
- Up to 120 telephone communication channels

With a particular view to facilitate installation, provision is made for multiplexing on a single parabola either two transmitters or two receivers or a transmitter and receiver

Advantage in the choice of the 11000 Mc/s band
— Less encumbered frequency band
— Lightening of the material (both by reduction in weight & volume)

Possibility of use as a fixed station
Material built in separate units easily portable by one person
No special equipment needed for mounting

SOME FACTS CONCERNING THE WORK OF INTERVISION IN THE LAST YEAR

By Aleš Suchý Head of the Intervision Programme Coordination Centre.

Ales Suchy

The last year has been marked by a permanent increase of the scope of work of Intervision both inside the extensive Intervision network and between Intervision and Eurovision.

In May, 1964, the Intervision member countries started a regular exchange of topical news items over the television network which proved successful, being of great importance for the timely delivery of information to TV viewers. Naturally, this exchange requires a perfect organization, high degree of discipline from the part of all participants and a good technical preparation. Considered must be also the big distance among the individual member organizations participating in the news exchange, i.e. among Moscow, Berlin, Prague, Budapest, Bucarest and Sofia.

The steady growth of television programmes transmitted over the common network is best shown by the following data:

Year	Number of broadcasts	Duration (hours)
1962	295	1018
1963	474	1669
1964 (first half)	423	1581

Daily average of all broadcasts:

1962	0.81
1963	1.21
1964 (first half)	2.32

Daily average duration of broadcasts including preparation time:

1962	3.45
1963	3.5
1964 (first half)	3.75

The Intervision network, serving the exchange of television programmes, is being expanded and improved steadily. Temporary and lowquality installations are replaced by new and modern ones. Provision of a sufficient reserve is also not forgotten. Putting into operation of the Moscow—Katowice and Prague—Berlin coaxial cables undoubtedly played a big role in the improvement of the level of the whole network.

The Intervision Technical Commission is busily preparing such a perspective expansion of the Intervision network which would enable the international exchange of television programmes independent of the national programmes of the individual member countries.

Also the exchange of programmes between Intervision and Eurovision is steadily increasing as witnessed by the following data:

Number of broadcasts relayed

Year	From Eurovision to Intervision	From Intervision to Eurovision
1962	37	—
1963	72	36
1964 (first half)	108	44

The last meeting of OIRT and EBU representatives held in Helsinki recommended the extension of the mutual programme exchange between both organizations. In the centre of attention were artistic programmes, relays of concerts of symphony music and variety programmes followed by relays from museums, galleries and exhibitions.

In 1965 on the occasion of the 20th anniversary of the United Nations Organization a whole series of artistic broadcasts prepared by the individual OIRT or EBU members or groups of members will be realized.

In the framework of OIRT and EBU also song festivals are planned which will certainly arouse a considerable interest among viewers of both organizations.

The cooperation in the field of sports relays is being continued, and joint relaying of all important events in the sporting life is introduced.

Regular holding of consultations between the permanent bodies of both organizations and mutual help in the solution of questions, interesting for members of both organizations have been recommended.

A wider exchange of news items between Intervision and Eurovision members on the basis of a direct exchange over the network is also planned.

Contacts in the juridical field have been also established.

In general it can be said with right that Intervision has become a clear notion and asserted itself with television viewers.

Today Intervision programmes bring a variety of entertainment and education and represent a practical realization of the noble idea of cooperation among all nations, and peaceful coexistence on the whole world.

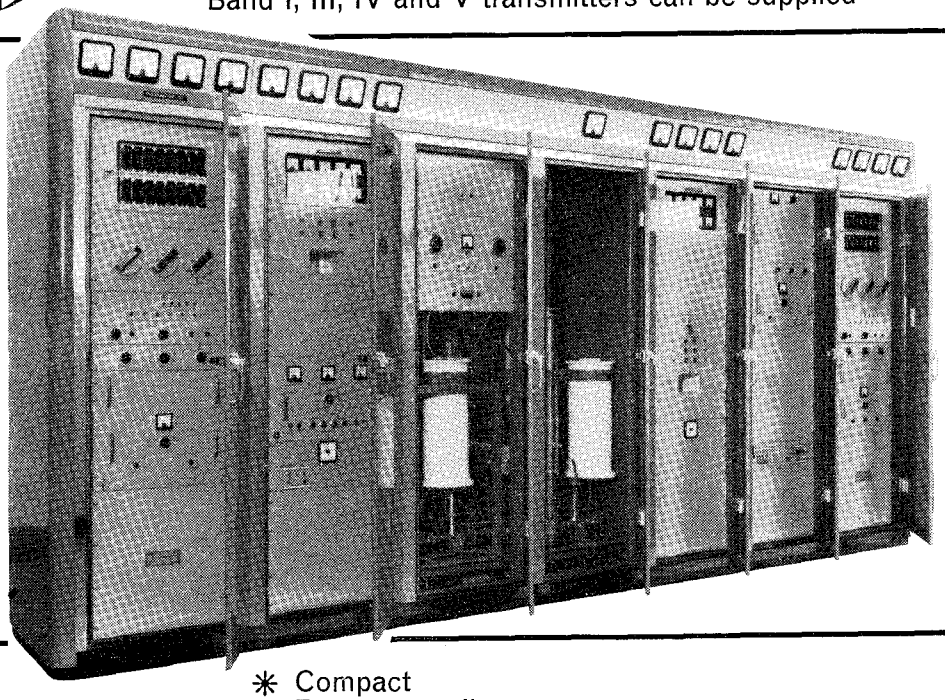
We want your help

We wish to get in touch with shortwave enthusiasts in all countries who will cooperate with us for the following purposes:

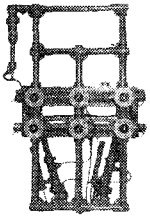
- Help us to create touch between short wave fans in all countries.
- Help us to spread knowledge of WRTH by, for example, distributing our brochure to interested friends and acquaintances.
- Send us from time to time reports on the results of your listening in order to make the Summer Supplement as correct as possible.
- Send us your criticism and wishes about the contents of WRTH. Write to World Radio TV Handbook Co. Ltd., Sundvej 6, Hellerup, Denmark.

5kW TELEVISION TRANSMITTER

Band I, III, IV and V transmitters can be supplied



- ✳ Compact
- ✳ Easy to install
- ✳ Simple RF circuits
- ✳ Comprehensive monitoring facilities
- ✳ Suitable for unattended operation
- ✳ Includes vision and sound transmitters and combiner
- ✳ Two transmitters in parallel give 10kW with maximum reliability of service coupled with excellent standby facilities



Six switch Antenna feeder selector for parallel operation of transmitters

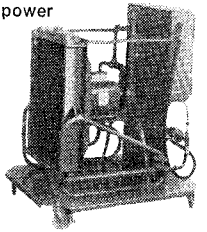
Pye offer a large range of accessories for

COMPLETE TV STATION INSTALLATIONS

including

RF feeders and switches
RF test loads and diplexers
Picture and waveform monitors
Control consoles and many other items of equipment

5kW portable test load unit for calormetric measurement of RF power



MANUFACTURED BY PYE T.V.T. LTD. CAMBRIDGE, ENGLAND

COLOUR-TELEVISION STANDARDS FOR EUROPE

by Georges Hansen

Director of the Technical Centre of the European Broadcasting Union

Vice-Chairman of C.C.I.R. Study Group XI (Television).

No conclusion was reached in 1964 as to the choice of a Colour Television System for Europe. This does not mean that much effort has not been devoted to solving this problem which is of course a complex and delicate one and has far-reaching consequences. I reported in the 1964 edition of the World Radio and TV Handbook on the work undertaken by the E.B.U. which, in November, 1962, formed an Ad-hoc Group composed of specialists from E.B.U. Members, Telecommunication Administrations and radio manufacturers effectively engaged on tests of colour-television systems, the countries represented being France, the Federal Republic of Germany, Italy, the Netherlands, Switzerland and the United Kingdom. The Chairman of the Group is Professor R. Theile, Director of the Institut für Rundfunktechnik, Munich.

Based on the work undertaken since its creation until the middle of October, 1963, the Ad-hoc-Group published at the end of 1963 a 40-page report entitled "Report of the E.B.U. Ad-hoc Group on Colour Television" which gives the results of the comparison of the three colour-television systems taken into consideration, namely the NTSC, SECAM and PAL systems. The work of the Ad-hoc Group is summarised in a more detailed, 163-page, document also published by the Group and entitled "Record of investigations undertaken by the E.B.U. Ad-hoc Group on Colour Television". These documents were submitted to the meeting of the Colour-Television Sub-committee of C.C.I.R. Study Group XI, which met in London from 14th to 25th February, 1964.

No conclusion was reached at that meeting concerning the choice of a colour-television system for Europe and the matter will have to discussed at the meeting of C.C.I.R. Study Group XI, which will open in Vienna on 24th March 1965. The Colour-Television Sub-committee drew up a report on the comparison of the competing systems, based to a very large extend on the report of the E.B.U. Ad-hoc Group. Let us say in brief that in many respects the qualities of the systems do not differ markedly, although the actual importance attached to each of these qualities may differ depending on the interests of the authority concerned. The NTSC system, which has been used in the U.S.A. for more than ten years, would benefit, particularly in the fields of receivers, from the industrial experience there. The cost of the receivers would be slightly less than for the PAL and SECAM systems. The NTSC system is better than the PAL or SECAM systems in respect of compatibility, that is the quality of the picture as received on normal black-and-white receivers. The PAL system is less sensitive to differential-phase distortion than the NTSC. Recordings may be made relatively easily on this system. The SECAM system is almost insensitive to changes of phase and permits recording and reproduction of pictures on ordinary monochrome video tape-recorders. For transmission over long radio link chains, the PAL and SECAM systems require less severe equipment-performance tolerances than does the NTSC.

A demonstration was given by the E.B.U., during the meeting of its Technical Committee in April, 1964, of the transmission of colour-television programmes over radio links in Europe. Programmes were transmitted from Rome using the PAL system, from Paris using the SECAM system and from London using the NTSC system. The demonstration was highly successful and gave an idea of what Eurovision may look like when colour television is introduced in Europe. It may be mentioned here that this introduction will take place in some countries as early as 1967. In the United Kingdom notably, a regular colour-television service will start early in 1967, according to a statement by the Postmaster General in the House of Commons on 14th April, 1964, this statement being based on a recommendation of the Television Advisory Committee.

It appears therefore that the last opportunity to reach a European agreement on colour-television standards will be at the C.C.I.R. Study Group XI meeting in Vienna from 24th March to 7th April, 1965. Steps have been taken to provide the best possible conditions for making a choice then. A new programme of work and tests has been arranged by the E.B.U. Ad-hoc Group. A complementary report to the one issued in 1963 will be prepared and submitted to the C.C.I.R.

It is important that the same colour-television standards be adopted in Eastern and Western Europe and since 1963 an exchange of information has been arranged between the E.B.U. and O.I.R.T. on the studies and trials of the colour-television systems. This cooperation has been further strengthened. Delegates from the E.B.U. took part as observers in a meeting of the O.I.R.T. Study Group III in Sofia on 18th August, 1964. Conversely, observers from the O.I.R.T. were invited to a meeting of the E.B.U. Ad-hoc Group in December, 1964 at Hilversum, and a joint meeting of the E.B.U. and O.I.R.T. experts is planned for the beginning of 1965. An important series of demonstrations was given in London from 26th to 29th October, 1964, to which demonstrations were invited not only the Members of the E.B.U. Ad-hoc Group, but also O.I.R.T. experts. It is hoped that all these coordinated efforts will make it possible to agree on a common colour-television system for all the countries of Europe at the time of the C.C.I.R. Study Group XI meeting in Vienna.

Frankly, WRTH is not for everyone.
It is not for the person with an idle mind—but written and prepared for the listener and radio-station, etc. with an open mind to what is going on within the wonderful world of Radio and TV . . . So we hope that the WRTH is for you —and that's why we invite you to take advantage of the yearly **Summer-Supplement** to the WRTH, which is published in June each year bringing your WRTH completely up-to-date. Available from your bookseller—or from WRTH Co. Ltd. —at the following prices:
$ 1.80, £ 0/12/0, D kr. 12.25 per copy, **plus postage:** $ 0.20, £ 0/1/6, D kr. 1.25 per copy.

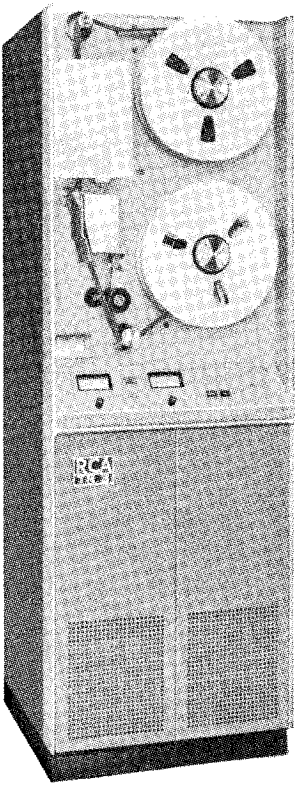
NEW TR-4



NEW TR-3

Want total performance in a compact ? This new fully transistorized TR-4 does just about everything the deluxe model does. And it's compatible with all quadruplex recorders. Makes professional quality tapes. Uses standard modules like RCA's deluxe TR-22 Recorder. Has space for Pix Lock, ATC, Color ATC, and electronic splicer modules. Completely contained in one 83.8 cm × 55.9 cm × 167.6 cm unit.

Want playbach only ? Here's the TR-3 tape player, a simple low-cost, high quality machine for playback of all standard tapes. Use it for "screening" commercials and programs or for putting them on air. Completely compatible with all standard quadruplex recorders. Fully transistorized for compactness and dependability. Standardized and modularized. Space for color modules.

See the entire RCA line before you buy any TV Tape Recorder

See your RCA Distributor or write: RCA International Division, 30 Rockefeller Plaza, New York 20, N. Y., U.S.A.

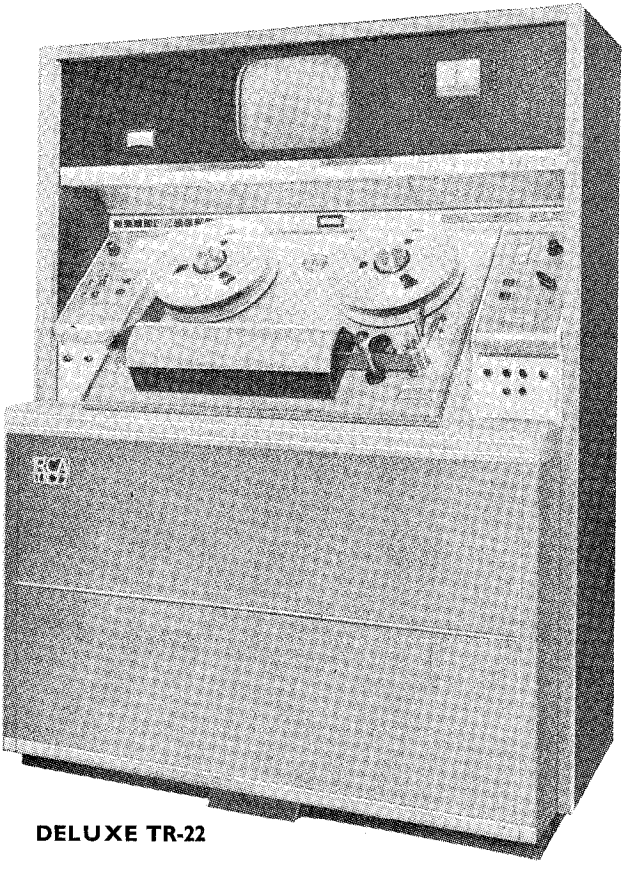
NEW TR-5



DELUXE TR-22

Want mobility ? By putting this compatible, lowcost, all-transistor recording unit on wheels and lowering its height to only 81.3 cm we've solved a lot of taping problems. The TR-5 records tapes in the field that you can play back on all standard quadruplex recorders. Records in color as well as in black-and-white.

Want the very finest ? It's not exaggeration to say the incomparable TR-22 is the most desirable of all TV Tape recorders. Its striking functional design is backed up by operating features that make quality tapes a simple certainly. Any studio can benefit from this symbol of the finest in compatible quadruplex TV Tape Recorders.

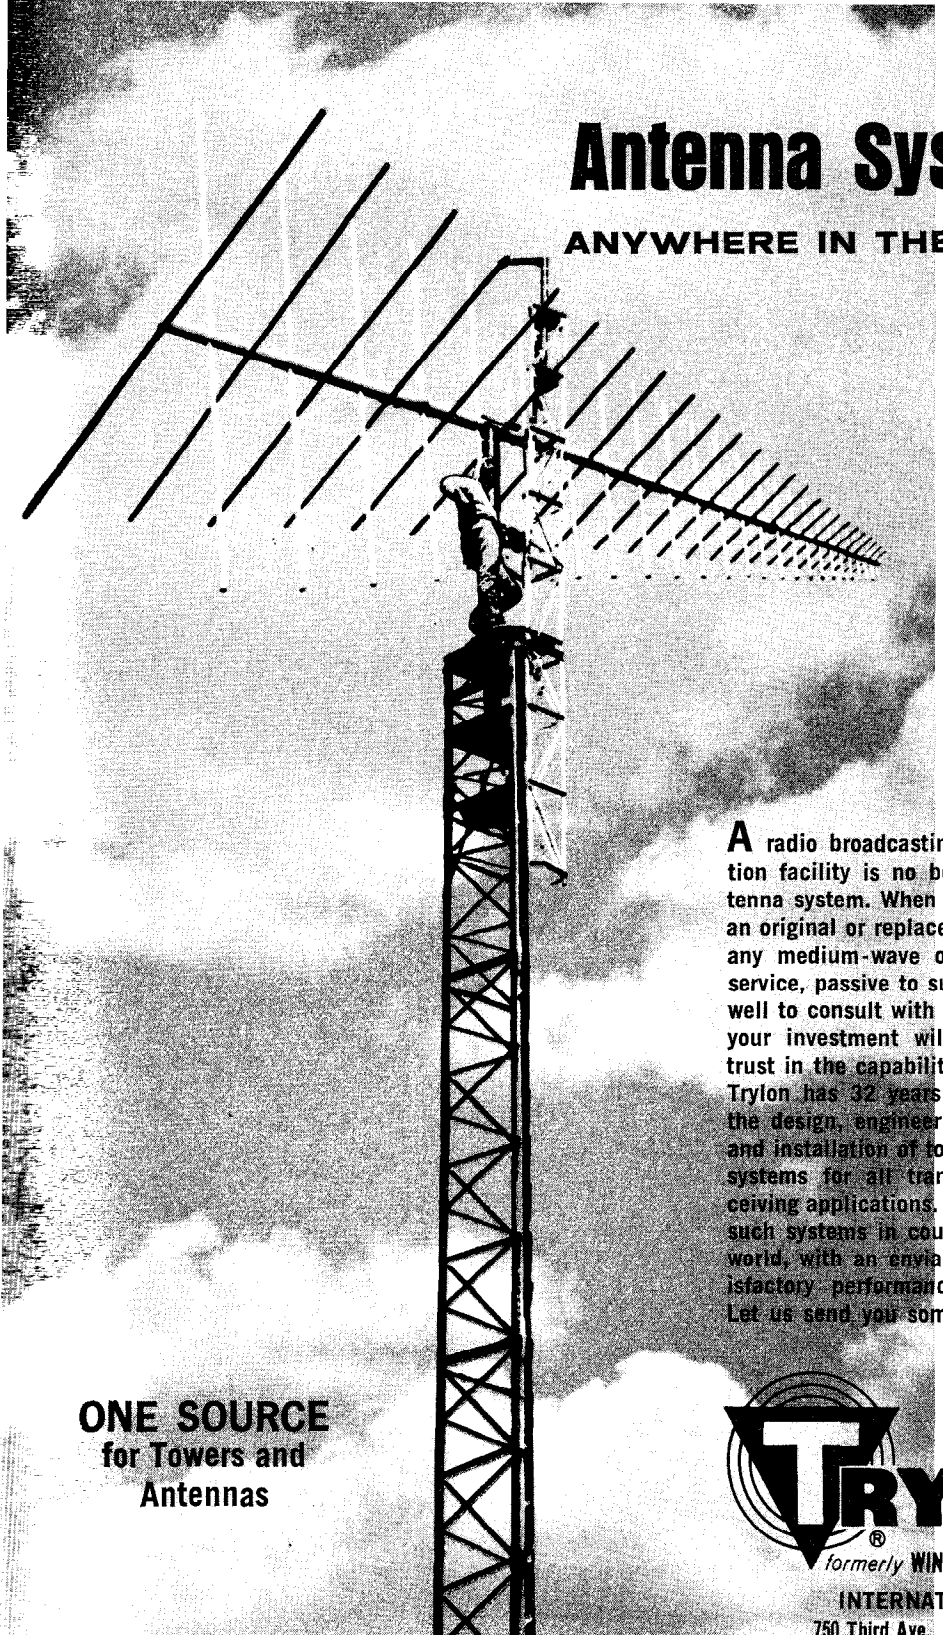
Antenna Systems

ANYWHERE IN THE WORLD



A radio broadcasting or communication facility is no better than its antenna system. When you have need of an original or replacement antenna for any medium-wave or high-frequency service, passive to superpower, you do well to consult with Trylon—for finally your investment will be made upon trust in the capability of the supplier. Trylon has 32 years of experience in the design, engineering, manufacture, and installation of towers and antenna systems for all transmitting and receiving applications. We have installed such systems in countries around the world, with an enviable record of satisfactory performance and economy. Let us send you some technical data.

Why station owners – all over the world – choose their equipment from the PHILIPS range

They do so for some very good reasons:

- Philips' reputation for reliability and after-sales service, maintained since the earliest days of radio (our first broadcast went on the air in 1923, our TV experiments date back to 1935).

- Philips engineers survey, plan and install the entire system, whether it consists of a simple audio amplifier or a complete TV network. And whether the site is on the equator - e.g. Quito, Ecuador - or within the polar circle - like the FM and TV station at Kiruna in Sweden.

- Philips equipment covers the complete range from microphone to broadcast transmitter, from TV camera to aerial, from line amplifier to radio link.

INTERFERENCE, JAMMING - AND YOU

by S. B. Duke, President of Radio Canada Shortwave Club

Reading left to right, S.B. (Pip) Duke, Supervisor of Engineering Services, CBC International Service and the President of the Radio Canada Shortwave Club. Simone Rubal, Club Secretary and Duncan Nicholson, Assistent Supervisor of Engineering Services, CBC International Service and Vice-President of the Club.

By interference, we usually mean man-made noise which will detract from the intelligence of the desired signal. But in this article, we will also discuss other types of interference encountered in shortwave reception. For example, static (atmospherics), extra-terrestrial or cosmic noise and — jamming.

Perhaps the most common types of interference (known as QRM) on the international shortwave broadcasting bands today are: —

Heterodynes
of low or high frequency depending upon the audio note (whistles) produced by the beating together of the carrier waves of the desired station and the interfering station. The heterodynes, or whistles referred to here, are usually of constant pitch.

Modulation
spread (or splash) causes adjacent-channel interference when it is heard above the program of the desired station. Due to the current seriously overcrowded condition of the international shortwave broadcast bands, radio stations are forced to operate very near—or even on each others' frequencies. Since the Administrative Radio Conference, Geneva 1959, notifications of frequency usage are accepted by the International Frequency Registration Board with only 5 kc/s separation. Of course such circumstances require increased selectivity in receiving equipment if the various signals are to be received without undue mutual interference. The less selectivity a receiver possesses, the less ability it has to separate these signals sufficiently to provide clear reception. The decision to adopt a 5 kc/s separation principle was no doubt due to the chronic overcrowding of the shortwave broadcast bands and of course many stations were already operating on frequencies 5 kc/s (or less) from their neighbours on the tuning dial. Therefore, to recapitulate, **adjacent-channel interference** is due to the modulation of one station spilling over onto the program of another station (or stations) operating 5 kc/s away.

Co-channel interference can be recognized by the presence of two intelligible signals on the same frequency when each signal is approximately the same strength. Sometimes, when one of these signals is much stronger than the other, it will completely, or almost completely blanket its unwilling bedfellow. The main contributing factor to **co-channel intereference** is, once again, the serious overcrowding of the international shortwave broadcast bands. Insufficient geographical separation between mutually interfering stations, off-beam antenna radiation and insufficient geographical separation between target areas are other factors contributing to co-channel and adjacent-channel interference.

Code
signals on or near the operating frequency of a broadcasting station often cause interference which an experienced shortwave listener will be able to recognize as morse (CW), facsimile, radio-teletype (RTT) and so on. Sometimes, this interference at the receiver may be caused by a harmonic of the fundamental (or operating) frequency of the interfering station.

Noise
can be sub-divided into two types, atmospheric, (extra-terrestrial or natural noise) (QRN) and man-made noise such as car ignition, starter lights, dirty commutator brushes etc., (QRM). There are two types of natural noise, atmospheric and extra-terrestrial (sometimes called cosmic or galactic noise). Atmospheric noise is the most erratic. It varies with the time of day, season of the year, the weather, and increases the nearer one gets to the equator. The crashing noise heard in a receiver, resulting from a lightning flash, is a good example of this type of noise. Extra-terrestrial or galactic noise is unlikely to be heard below about 18 or 20 Mc/s. It sounds like a steady hiss and increases rapidly during some types of solar disturbance.

But the noise most often heard by the shortwave listener is that caused by lightning flashes in our atmosphere. Don't forget, a lightning flash, is a form of transmitter and propagates an electric impulse (similar to a radio wave) over great distances. A large flash in West Africa may well add to the background noise, and so interfere with reception in Europe.

While we are discussing this problem of interference, it will be appropriate to mention the information most useful to shortwave radio station engineers and which should be included in any reception report:

I identify all types of interference—first by type such as CW, jamming, modulation splash, heterodynes and so on.
II identify the source of the interfering signal, call-sign, language of announcements, nationality of the station, interval signal etc.
III operating frequency of the interfering station.
IV the degree (or strength) of the interference in terms of degradation of the required signal. Here the SINFO code is very useful. The judgement of the operator or shortwave listener is necessarily subjective in this assessment.

There is another form of interference encountered in the international shortwave broadcast bands and that is JAMMING.

Jamming means the deliberate interference with a transmission by imposing on it another signal to prevent reception or to make the transmission unintelligible. Fundamentally, jamming interference is

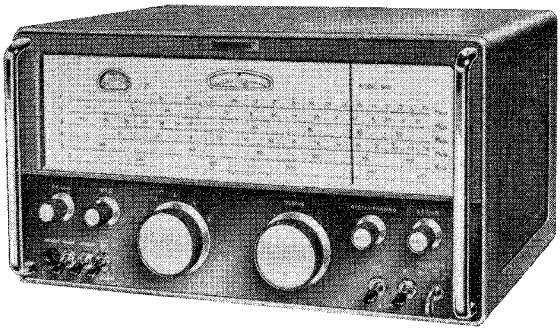
EDDYSTONE
COMMUNICATIONS RECEIVERS

FAMOUS THROUGHOUT THE WORLD FOR THE HIGHEST STANDARDS OF PERFORMANCE & ENGINEERING



Illustrated above is the EDDYSTONE "940", the specification of which includes two RF stages (the first of the cascode type); two IF stages with crystal filter; push-pull output-noise limiter and many other refinements. Standard AC mains operation. This model has high sensitivity, variable selectivity, and wide coverage. With its robust construction, it is the right choice for the enthusiastic short wave listener and is suitable also for professional use.

The range of EDDYSTONE radio receivers for professional applications is very wide and includes highly developed models covering from 10 kc/s to 1000 Mc/s. There are also specially designed models for Marine, Amateur and semi-domestic use, some using valves, others of the transistor type. Other EDDYSTONE products include complete panoramic receivers and panoramic display units for use with most types of communications receiver.

Please write the sole manufacturers, indicating your particular interest, for comprehensive information and address of nearest Agents.

CABLES: STRATNOID, B'HAM. TELEX: 33708 TEL.: PRIory 2231/4

a broadcast or a number of broadcasts of noise signals, perhaps a tape recording of a diesel motor. It is easily recognizable by the "harsh roar" characteristic. The interference (QRM) from such transmissions may be either ADJACENT CHANNEL or CO-CHANNEL. If of the adjacent channel type, it is called "JAMMER SPLASH". Sometimes, jamming transmissions are sufficiently broad, or wide-band, to cover more than one channel.

What can be done to remove or suppress jamming? First, we should be quite clear about one thing. The possibility of ending the effects of jamming by various new techniques and vague panaceas is misleading. Jamming can only be stopped by switching off the jamming transmitters. This will probably be effected through political rather than technical action. For, as new or improved methods are developed to minimize the effects of jamming, so improved methods of jamming are also found. Some of the technical ways to combat jamming include the use of more powerful transmitters to beam the program into the target area, the greater use of overseas rebroadcast bases located nearer the target area, the use of a greater number of transmitters carrying the same program—even "barrage" transmissions of fifteen or twenty senders, each on a different frequency. Then there are improvements to directive antenna systems—so narrowing the beam and improving directivity and gain. Speech clipping techniques are also used to provide the maximum amount of intelligence under adverse reception conditions in the target area.

At present, the international shortwave broadcast bands are chronically overcrowded and the situation is now acute due to the current sunspot minimum conditions. Many users of the higher frequency bands such as 13 and 16 meters must now make greater use of the 19, 25 and 31 meter bands and even lower HF bands during hours of darkness. It is generally conceded that the need for so many frequencies to carry a particular program would diminish if so many channels were not rendered unusable by jamming or jammer splash.

So far as jamming interference is concerned, there is little that the average shortwave listener can do to rectify the situation. It is true that shortwave receiving and monitoring stations operated by the professional shortwave broadcasting organizations possess equipment which can do much to remove the degrading effects of jamming from a signal. But it is quite complex equipment and highly expensive. The use of directional receiving antennas helps to reduce this type of interference but again, such antenna arrays are quite large and very expensive. A very selective receiver is useful, especially if it has a selectivity switch with a number of positions so that the band-pass can be varied.

However, it will take much more than the equipment available to the average shortwave listener to overcome the effects of jamming or jammer splash. There must be a realistic re-appraisal of the whole situation by jammer and jammed. That there already has been much progress in this direction is clear to anyone listening regularly on shortwave. A dramatic reduction in jamming of western broadcasts on the shortwave bands became apparent at the end of June 1963. From that time, jamming of western broadcasts has very much diminished and nowadays, what jamming remains is directed mainly against a very few shortwave broadcasting organizations. But there is a long way to go yet. However, with goodwill and mutual trust it should still be possible for broadcaster and listener to communicate together in dignity and peace.

SOLAR ACTIVITY IN 1965

by Professor M. Waldmeier, Zürich

Solar activity strongly influences the ionosphere and the high frequency radio communications. The mostly used index of the solar activity is the so-called sunspot-relative-number. This index is known for more than two centuries. It shows the well-known variations in solar activity with a period of about 11 years. For practical use the daily relative-numbers for the expired month as well as predictions for the coming six months are emitted by the Swiss Shortwave Service. The present emission-time-table valid till May 2nd, 1965 is as follows:

Destination of Emission	Time of Emission[1])		kc
In English:			
Great Britain	12.55	U.T.*	7110, 9665
North America	09.10p.m.	E.S.T.*	6080, 6105, 9535

[1]) **Dates of Emission:** * Sat. 7/11, 5/12 1964, 9/1, 6/2, 6/3, 3/4 1965. — **) Sun. 8/11, 6/12 1964, 10/1, 7/2, 7/3, 4/4 1965. — ***) Night from Sat. to Sun.

The relative-number has decreased rather regularly since the high maximum in 1957. The annual means are as follows:

1957 190, 1958 185, 1959 159, 1960 112, 1961 54, 1962 38, 1963 28.

The mean value for 1964 will be around 8. Actually sunspot-activity is at its minimum. Long before the old cycle came to its end, spots of the new cycle have appeared. The first one was a small one-day-spot on August 28, 1963. Up to the end of 1963 three more and larger spot-groups of the new cycle have appeared. During 1964 the number of the groups belonging to the old cycle was steadily decreasing, whereas the new cycle spots were increasing in number. In the last quarter of 1964 old and new cycle spots will be about equally frequent and this marks the epoch of the minimum of the sun's activity. As the old and the new cycle are strongly overlapping, in no month the sun will be completely quiet. The lowest smoothed monthly relative-number will be about 7. From the beginning of 1965 the relative-number is to be expected to increase again, but at a low rate. From about 8 at the beginning it will rise to about 18 at the end of the year. This means that the conditions in high frequency radio communications practically will be the same as in 1964. Some years ago the two years 1964 and 1965 have been declared as the years of the quiet sun. This interval has been well chosen, as the minimum of the sun's activity comes just in the middle of it.

RELIGIOUS BROADCASTING ORGANIZATIONS

PROTESTANT

WORLD ASSOCIATION FOR CHRISTIAN BROADCASTING

(formerly "World Committee for Christian Broadcasting"), constituted at its Limuru, Kenya, Assembly, May, 1963.

Purpose: "to provide a working fellowship of churches, agencies, organizations and persons concerned with the use of radio and television to proclaim the Christian Gospel in its relevance to the whole of life, and with the role of these media in society" (WACB Constitution).

Address: Edinburgh House, 2 Eaton Gate, London S.W. 1.

Chairman: Bishop Dr. Fridtjov Birkeli, Stavanger, Norway–Vice-chairman: Rev. K. D. Bhasker, 15, New Civil Lines, Jabalpur, M.P., India–Secr: W. N. Haddad, Box 5376, Beirut, Lebanon–Treasurer: Rev. F. R. Wilson, 475, Riverside Drive, New York 27–Executive Director: Rev. Edwin H. Robertson, Edinburgh House, 2 Eaton Gate, London S.W. 1., England. Associate to the Exec. Dir: Rev. C. Michael de Vries, 150 Route de Ferney, 1211 Geneva 20, Switzerland–Regional Repr's: Africa, E. Fashade, Box 67, Ilesha, Nigeria–Asia, M. Ogawa, Christian-AV Center, 22, Midorigaoka, Shibuya Ku, Tokyo. Europe, Rev. Dr. R. Ley, Stäfa, Zurich, Switzerland. Latin America, Dr. A. J. Ribeiro, C.P. 943, Campinas, São Paulo, Brasil. Near East, W. N. Haddad Box 5376, Beirut, Lebanon. No. America, Dr. H. C. Spencer, 1525, McGavock Str, Nashville, Tennessee, U.S.A. Editor "The Christian Broadcaster": Rev. H. H. Hoskins, BBC, London W. 1. Editor "Medium" (German): Christian Hoffmann, Birkerstrasse 22, 8 München 2, Germany.

WORLD COUNCIL OF CHURCHES

The Rev. C. Michael de Vries, Secretary for Work in the Field of Broadcasting, Dept. of Information. Addr: 150, Route de Ferney, 1211 Geneva 20, Switzerland.

The Lutheran World Federation. Same address. The addr. of the Lutheran World Federation Broadc. Sce. is P.O. Box 654, Addis Ababa, Ethiopia – Dir. of Broadc: Rev. S. Aske, Ph. D. – Public- occasional newsletters.

ROMAN-CATHOLIC

Pontifical Commission for the Communications Media.

Addr: Palazzo S. Carlo, Vatican City State.

Pres: Archbishop of Lacdicea in Syria the Most Reverend Martin J. O'Connor.

UNDA: Association catholique internationale pour la Radiodiffusion et la Télévision (International Catholic Organization for Broadcasting and Télévision).

Protector: Bishop of Lausanne, Genève and Fribourg, Mgr. François Charrière, Fribourg, Switzerland.

Secretariat General: Rue de Romont 5, Case Postale 211, 1701 Fribourg, Switzerland.

Administrative Council: consist of 12 members.

Pres: Mgr. J. Haas, Lausanne, Switzerland. Consultative status at UNESCO.

Secretariat for Latin America: 385, Rua São Clemente, Rio de Janeiro. Dir: Miss Marina Bandeira de Carvalho, Rio de Janeiro, Brazil.

Members of the Organization:

Ordinary members: Germany, England, Austria, Belgium, Scotland, Spain, France, Ireland, Italy, Luxembourg, Monaco, Netherland, Switzerland, Vatican State.

Brazil, Bolivia, Canada (English- and French speaking sections), Chile, USA, Venezuela, Madagascar (Malgasy Rep).

Extraordinary members: Denmark, Portugal, Sweden, Malta, Argentina, Curaçao, Haiti, Dominican Rep, Guadeloupe, Martinique, Panama, Costa Rica, Nicaragua, Honduras, Guatemala, El Salvador, Puerto Rico, Colombia, Mexico, Peru, Paraguay, Uruguay, St. Lucia, French Guiana, Ecuador.

North. Rhodesia, Burundi, Congo (Léopoldville), Congo (Brazzaville), Ivory Coast, Central African Rep, Dahomey, Upper Volta, Rwanda, Senegal, Togo, French Somaliland, Réunion, New Caledonia, Algeria, South Africa Rep, Japan, Philippines, Vietnam, Australia, Taiwan, Trinidad.

Corresponding members: Finland, Norway, Dutch Guiana, Greece, Egypt, Morocco, Tunisia, Angola, Mozambique, Basutoland, Hong-Kong, Tasmania, India, Pakistan, Lebanon, Iraq, South Korea.

UNDA-Revue: French and English.

UNDA-Nouvelles: French and English editions.

The Secretariat for Latin America publishes a monthly publication by the name of "Informe de UNDA América Latina".

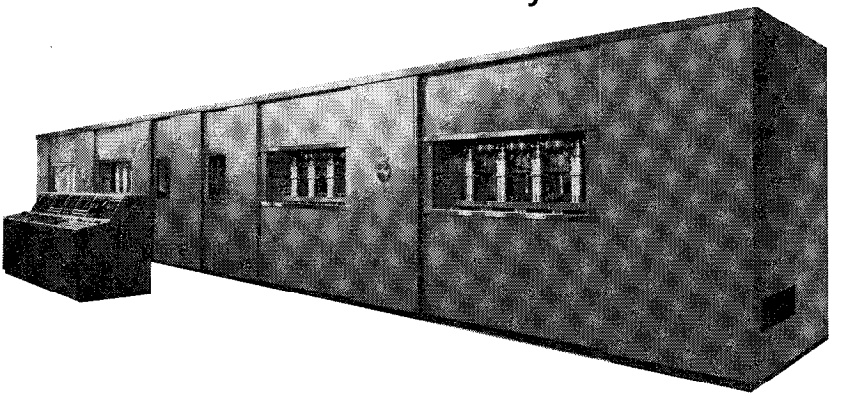
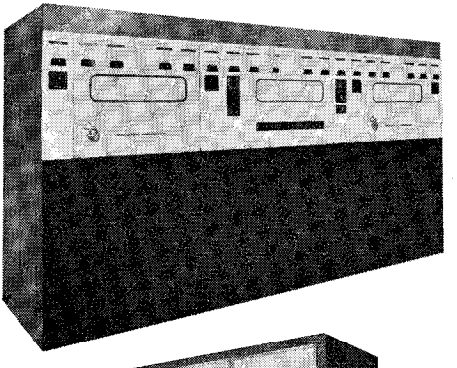
Continental Medium Wave Broadcast Transmitters Set New Standards of Efficiency and Performance!



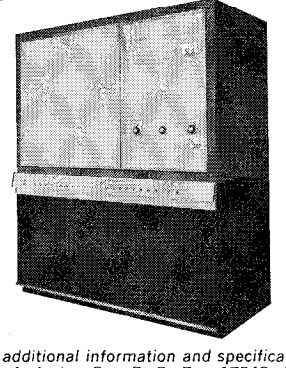
TYPE 323B 1,000,000 WATT AM MF BROADCAST TRANSMITTER

Designed for operation in the standard broadcast band, Continental's 1,000,000 watt transmitter consists of two Type 320B 500,000 watt transmitters which are combined to provide a power output of 1,000,000 watts. These were the first super power transmitters built for the Voice of America, and were installed at Munich, Okinawa and Manila in 1953.



TYPE 317C 50,000 WATT AM MF BROADCAST TRANSMITTER

- High efficiency screen modulated power amplifier*
- Highest overall efficiency of any 50 kw transmitter known to be in existence today
- Both power amplifier tubes operate as conventional class "C" amplifier
- Modulator operates similar to push-pull class "B" amplifier
- Requires only 54 sq. ft. of floor space



TYPE 315C/316C 5,000/10,000 WATT AM MF BROADCAST TRANSMITTER

- Regulinear screen modulation system**
- Power increase from 5 kw to 10 kw without major circuit changes
- Centralized controls
- Requires only 34" x 66" of floor space
- Power supplies use solid state rectifiers
- Air cooled
- Only four tube types

*Patents applied for **U.S. Pat. 2,918,631

INTER-CONTINENTAL TELEVISION PROGRESS 1964 - FUTURE 1965

By Edgar T. Martin, Engineering Manager, Voice of America, Washington, D.C., 20547 and George Jacobs, Chief, Frequency Division, Voice of America, Washington, D.C., 20547.

Inter-continental television relay via space satellites continued to make considerable progress during 1964. Although still in an experimental stage, satellites made possible the relay of television programs between North America and Europe on no fewer than 100 occasions during the year. Inter-continental television was also extended to both Europe and North America from the Far East for the first time.

Three new communication satellites were successfully launched by the United States of America during 1964. On January 21, RELAY 2 joined RELAY 1 and TELSTAR 2 in relaying television signals across the Atlantic Ocean. On March 27, RELAY 2's orbit was also favorable for the first two-way live television exchange between Japan and the United States.

On January 25, the ECHO 2 passive reflector satellite was placed into orbit. Measuring approximately 45 meters in diameter (135 feet), this huge satellite was used to reflect radio and television signals from its rigidized aluminum surface.

Experimental radio transmissions were conducted between the Soviet Union and Great Britain, and within North America, but ECHO 2's orbit is such that its use for inter-continental television is not possible.

One of the most spectacular space launchings of the year took place on August 19 when SYNCOM 3 was rocketed into space from Cape Kennedy. SYNCOM stands for synchronous orbit communication satellite.

By an intricate combination of celestial mechanics, rocket power, and ground control, SYNCOM 3 was placed into a stationary synchronous orbit 38,900 kilometers (22,300 miles) over the Pacific Ocean, directly above the intersection of the equator and the 180th parallel (the international date line). In this orbit, the satellite is stationary in relation to the earth, so that the spacecraft appears to be absolutely motionless in the sky.

From its high altitude, SYNCOM 3 can "see" almost one-third of the earth's surface extending from the western regions of the Western Hemisphere to the eastern regions af Asia. The satellite can maintain 24-hour communication over a large part of this area.

Although originally designed for radio relay only, SYNCOM 3 was modified shortly before launch to handle television signals as well. This made possible live television relays of the Japanese Olympics to North America.

No satellite previously has ever been launched into a stationary orbit. During 1963, SYNCOM 2 was placed into a 38,900 kilometer orbit above the Atlantic Ocean, but since it was not directly over the equator, it was not completely stationary and its orbit was a figure-8 pattern in space.

SYNCOM 2 figured in another spectacular space maneuver during 1964, when it was moved from its original location over the Atlantic Ocean to a new position over the south Pacific Ocean. This was accomplished by ground control of small rockets on the spacecraft. SYNCOM 2 is now relaying radio signals between Asia and the United States.

With four active communication satellites possessing television relay capability in operation during 1964 (TELSTAR 2, RELAY's 1 and 2, SYNCOM 3), inter-continental television was made available to more people, in more areas of the world, for longer periods of time than ever before.

From the aura of deep tragedy surrounding President Kennedy's funeral to the exhilaration of the Innsbruck and Tokyo Olympics; from the physical prowess demonstrated during the Liston-Clay world heavyweight boxing match to the political prowess

GEORGE JACOBS

George Jacobs was born on July 16, 1924, in New York City. He received his B. E. E. degree from Pratt Institute, Brooklyn, 1949, and his M. S. E. E. degree from the University of Maryland in 1960.

Mr. Jacobs is a representative of the Interdepartment Radio Advisory Committee (IRAC) and several other policy-level U.S. Government committees in the field of telecommunications. He has served as a delegate to several international broadcasting and telecommunication conferences, including the 1959 ITU Administrative Radio Conference, where he was the U.S. spokesman for high frequency broadcasting.

Most recently he attended the Tenth Plenary Assembly of the C.C.I.R and the I.T.U.'s International Space Communication Conference, both held in Geneva during 1963. Mr. Jacobs was the U.S. Delegation's spokesman for satellite broadcasting at both conferences.

Mr. Jacobs is a Senior Member of the IEEE, a member of URSI, and a registrated Professional Engineer in the District of Columbia.

EDGAR T. MARTIN

Edgar T. Martin was born on May 1, 1918, in Princeton, West Virginia. He received his B. S. E. E. in 1938 and his M. S. E. E. in 1953. both from Virginia Polytechnic Institute. He also holds an M. A. in Government from American University, conferred in 1957 and an LL.B. from George Washington University. In 1959, he earned his LL.M. from Georgetown University.

He is a registered Professional Engineer in Virginia and the District of Columbia, and he is also a member of the Virginia Bar. He has attended more than a dozen major international conferences dealing with broadcasting and telecommunications, and was a delegate to the ITU's Administrative Radio Conference held in Geneva.

demonstrated by the various candidates of the British and American elections, tens of millions of television viewers on three continents again bore silent witness to history in the making across the dimensions of geography and time zones — all simultaneous and instantaneous!

On October 22 of the past year, television viewers throughout Europe and North America were again given a glimpse into outer space, as a television camera aboard the spacecraft VOSKHOD transmitted pictures of the satellite's three-man crew back to earth. Relayed to the United States via Eurovision and a RELAY satellite, pilot-engineer Komarov, scientist Feoktistov and medical doctor Yegorov could be seen quite clearly as VOSKHOD orbited in space.

Of the more than 100 television transmissions relayed by satellites during 1964, perhaps the most interesting were those of the Tokyo Olympics.

Television viewers in North America watched on their screens as the 1964 Olympic Games opened in Tokyo's National Stadium on October 10. Much of the Olympic events were also seen in Europe either live as they were taking place, or delayed by only a few hours.

To accomplish this, television signals were sent by microwave from the stadium to the Kashima ground station 50 miles northeast of Tokyo. Kashima's 33-foot dish-shaped antenna beamed the signals up to the SYNCOM 3 satellite, where they were amplified and relayed down to the 85-foot dish antenna at the Point Mugu, California, ground station. The signals were then carried to Los Angeles by microwave, where they were distributed via normal channels to the National Broadcasting Company for showing over its network of stations in the United States.

The European Broadcasting Union and Canadian Broadcasting Corporation made arrangements to have the Olympic signals fed across the United States from Point Mugu to Montreal. Canada-wide broadcasts emanated from the CBC television studios in Montreal. The signals were also recorded in Montreal on magnetic video tape and flown to Europe on chartered jet aircraft for relay on European networks, thus permitting European audiences to see the Olympic events on the same day that they were taking place in Tokyo. Tape recordings sent directly from Tokyo took about 12 hours longer to reach Europe.

Some of the Tokyo Olympic events were also seen in Europe live. This was made possible by relaying SYNCOM 3's signals from Point Mugu to the ground station at Andover, Maine. At times when RELAY 1 was in proper orbit, Andover relayed the signals to the French ground station at Pleumeur-Bodou, and from there through conventional channels to television stations throughout Europe.

Serious consideration was also given during 1964 to the possibility of eventually broadcasting from satellites directly to the general public, without the necessity of going through ground station relays.

A major international conference held under the auspices of the International Telecommunication Union, amended the International Radio Regulations to include the following definition of a new "broadcasting satellite service:"

"Broadcasting-satellite service — A space service in which signals transmitted or retransmitted by space stations, or transmitted by reflection from objects in orbit around the earth, are intended for direct reception by the general public."

The ITU Conference also adopted a recommendation which now appears in the Radio Regulations. It points out that the use of satellite transmissions for direct reception by the general public of sound and television broadcasts may be possible in the future. The recommendation also urges that technical studies be expedited to determine the feasibility of eventually broadcasting from satellites. Experts consider these recent actions by the ITU as important steps toward the future possibility of the general public being able to receive radio and television programs in their own homes direct from satellites.

The era of inter-continental television began on July 23, 1962, when the first trans-Atlantic link was forged with the TELSTAR 1 satellite, which incidently, is now silent. Inter-continental television became of age during 1963 when TELSTAR's 1 and 2, and RELAY 1 made possible more than 130 television relays between North America and Europe. During 1964, as a result of the launching of RELAY 2 and SYNCOM 3, the limits of inter-continental television were further extended to reach into the Far East area.

The year 1965 may see an important change in inter-continental television. During the past year, as in previous years, satellite communications were conducted on an experimental basis. No American experimental communication satellites are planned for 1965, however, the first commercial system may begin operation during the year.

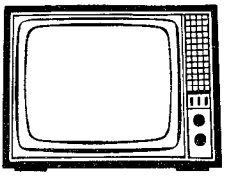
In the United States, the Communications Satellite Corporation has been established to develop this commercial communication satellite system. The governments of Australia, Belgium, Canada, Denmark, France, Germany, Ireland, Italy, Japan, Netherlands, Norway, Spain, Sweden, Switzerland, the United Kingdom and the Vatican City have already concluded agreements with the Corporation, giving it global status. Many other countries are expected to join with the Corporation during 1965 to bring operational communication satellite circuits to as many areas of the globe as technically possible.

Early technical plans released by the Corporation indicate their preference for the high altitude, or synchronous, system for operational use. The Corporation plans to have launched an "Early Bird" synchronous satellite during 1965, which will be placer in orbit 38,900 kilometers (22,300 miles) above the Atlantic Ocean as an initial link between North America and Europe, with links to other areas of the world to follow at a later date.

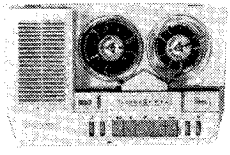
When an operational satellite communication system is established, the amount of inter-continental television material relayed will no doubt depend on the cost of relay as compared to the exchange of film or video tape by means of jet air transport.

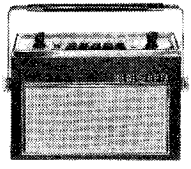
As science and technology conquer the barrier of distance in telecasting, it may be well to reflect a moment on the words uttered recently by a person of prominence:

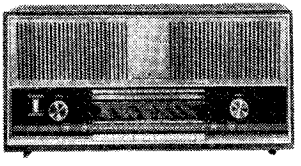
"A communication satellite is totally neutral. Its power supply, transistors, antennas, etc., have no conscience, no principle, no morality. It will broadcast trash or inspiration with equal facility. It will speak the truth as clearly as it will speak falsehood. It is, in the end, nothing more nor nothing less than the men who use it. We can only hope that it will always be used with talent and wisdom."

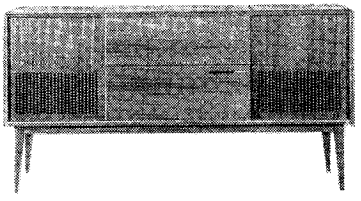


Something for Everybody - Thus the Right Thing for All









The essential feature of LOEWE OPTA programme is the large variety. But it is the superior craftsmanship which contributes much more to the world-wide popularity of the name of LOEWE OPTA. It is a name you can always rely on.

WHERE TO LISTEN FOR SATELLITE SIGNALS

By George Jacobs, Chief, Frequency Division Voice of America, Washington 25, D.C.

As the clock in the old town Geneva, Switzerland, struck midnight on November 8, 1963, a new era in communications began. At that moment, the last representative from the 70 nations attending the Space Communications Conference of the International Telecommunication Union affixed his signature to the Final Acts of the Conference. The Final Acts contain the results of this five week conference which succeeded in allocating frequencies, for the first time, to the various space communication services. On January 1, 1965, the Final Acts officially will become a part of the International Radio Regulations, the basic document governing the operation of radio throughout the world.

Every space satellite or space vehicle launched, whatever its purpose, is dependent upon communications for its link with the earth. The conference, attended by more than 400 scientists, engineers and government officials from 70 countries, discussed all facets of radiocommunication between earth and space, and between space vehicles. After five weeks of discussion and negotiation, the conference agreed to allocate frequency bands in the crowded radio spectrum to serve space communication requirements for at least the next generation. A total of nearly 6,100 megacycles have been allocated to the various kinds of space communication services in discrete bands between 10 mc/s and 32.2 gc/s (a gc/s, or gigacycle is equivalent to 1,000 mc/s). The success of the conference has been hailed by experts as a great step toward the eventual development of communication, weather and navigational satellite systems, as well as permitting expanded space research and exploration, both manned and unmanned.

The following h.f. and v.h.f. bands allocated by the conference to various space communication services are those that can be received by radio amateurs and space listeners with a minimum of special equipment. In addition, 27 bands were also allocated on higher frequencies, but it is unlikely that signals in these bands can be received without complex receiving equipment.

Band	*Purpose of Allocation*
10,003 — 10,005 kc/s	space research
15,762 — 15,768 kc/s	space research
18,030 — 18,036 kc/s	space research
19,990 — 20,010 kc/s	space research
20,007 kc/s	may be used in an emergency, in the search for, and rescue of, astronauts and space vehicles
30,005 — 30,010 kc/s	space research
39,986 — 40,002 kc/s	space research
136 — 137 mc/s	space research (telemetering and tracking)
137 — 138 mc/s	meteorological satellites, space research (telemetering and tracking) and space service
143.6 — 143.65 mc/s	space research (telemetering and tracking)
144 — 146 mc/s	radio amateur space activities
148.25 mc/s (± 15 kc/s)	space telecommand
149.9 — 150.05 mc/s	radionavigation satellites
154.2 mc/s (± 15 kc/s)	space telecommand
183.1 — 184.1 mc/s	space research
267 — 273 mc/s	space (telemetering)
399.9 — 400.05 mc/s	radionavigation satellites
400.05 — 401 mc/s	meteorological satellites (maintenance telemetry), space research (telemetering and tracking)
401 — 402 mc/s	space (telemetering)
449.75 — 450.25 mc/s	space telecommand
460 — 470 mc/s	meteorological satellites

The first satellites launched by the United States of America used frequencies of approximately 108 mc/s, but since 1960 almost all American satellites have contained a beacon or telemetry transmitter in the band 136 — 137 mc/s. Almost all of the satellites launched by the Soviet Union to date have used the 19,990 — 20,010 kc/s band, and many have also used the band 30,005 — 30,010 kc/s, as well as frequencies in a narrow band near 90 mc/s. Future satellites are expected to use frequencies in accordance with the allocations made at Geneva last year.

As of November 15, 1964, no fewer than 39 satellites were in orbit transmitting radio signals back to earth on 77 different frequencies. Many of the signals in the h.f. bands can often be heard well on relatively inexpensive short-wave receivers, while the signals in the v.h.f. bands can often be received with relatively simple frequency converters. The following list contains those frequencies on which space orbiting satellites were transmitting as of November 15, 1964. Many of these satellites are expected to continue to transmit radio signals during 1965. The satellites which should be heard with the least difficulty are those which transmit CW beacon signals. These signals can usually be identified by their steady tone when the receiver's beat frequency oscillator (BFO) is in the ON position. Telemetry signals may be somewhat more difficult to receive, since telemetry data, in most cases, is transmitted for brief periods upon command from the ground. Telemetry signals usually consist of two or more musical tones being transmitted at the same time, or in the case of the Russian COSMOS satellites, of a series of dots and dashes of different lengths.

Inclination and period data are given in the following list as a further aid in identifying satellites from which signals can be received. The inclination is the angle that the satellite's orbit makes with the equator. If a directional antenna is being used to receive satellite signals, the inclination data can be used for determining the direction from which the satellite's signal should be heard first. The satellite's period is the time it takes, in minutes, for the satellite to complete an orbit. By timing reception on successive orbits, it is often possible to identify the satellite whose signals are being received.

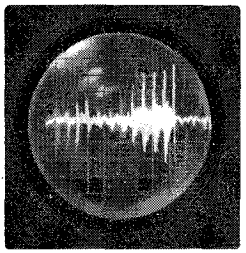
PROBLEM: SLOW THREADING

SOLUTION: THIS NEW 3M SELF-THREADING TAPE REEL

Simply lay tape inside reel and start recorder. Reel threads itself automatically. No hooks, no slots. Solid sides protect tape against damage. "Scotch" Brand 7" Self-Threading Reel has a snap-tight plastic cover for dust-proof storing without a box.



PROBLEM: TOO MUCH NOISE

SOLUTION: NEW 3M LOW NOISE RECORDING TAPES

New "Scotch" Brand Tapes (available in both acetate and polyester) increase signal-to-noise ratio 3db to 6db over conventional tapes. Improve high frequency response. Wear 15 times longer. Save tape because they operate at half your normal recording speed with no loss in fidelity.

Scotch® **BRAND TAPES AND REELS** are among scores of 3M audio-video advances. More information? Write: 3M, Minnesota Mining & Manufacturing Co., International Division, Box 3800, St. Paul 1, Minnesota, U.S.A.

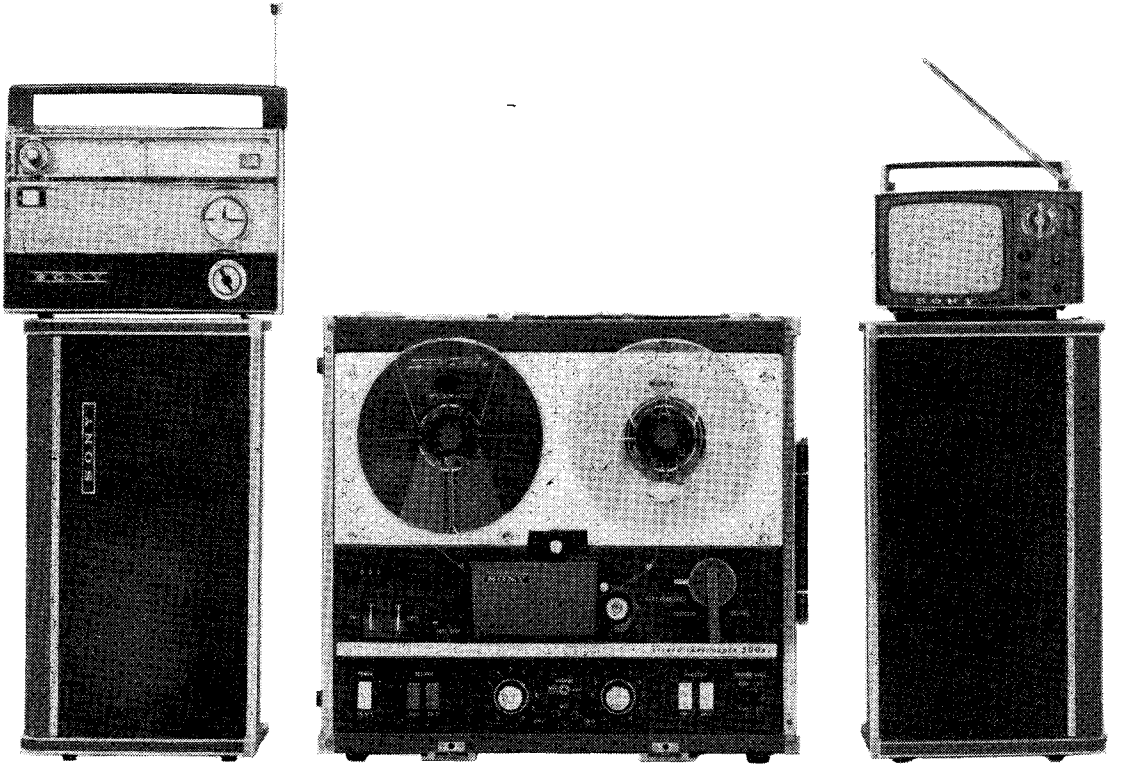
Confidence Also Makes A Difference



SONY'S research, planning and attention to detail are designed to give you confidence that you always get the best in a SONY product—the finest, most up-to-date performance features combined with the best in modern styling and quality construction. For example, SONY's Micro-TV, the world's smallest, has such fine features as automatic focus control, pulse-operated AGC and ANS to give stable, high-quality video and sound under the most difficult conditions. The TC-500A Recorder is a 4-track stereo system with a frequency range of 30-18,000 cps, and all professional features—instant stop, automatic tape lifters, fast forward and reverse; individual controls for playback, mike and auxiliary inputs. The TR-911 all-transistor, all-wave portable operates up to 24 Mc and has a tuning indicator, fine tuning control and tone control. Enjoy the extra bonus of confidence that goes with every SONY product.

Continued from page 50

The following list contains frequencies that are expected to be used on satellites that the United States plans to launch during 1965. The list is by no means complete, and some changes in frequency may be made before actual launch time. The list, however, can be used as a guide as new launches are announced.

LIST OF FREQUENCIES TO BE USED ON AMERICAN SATELLITES EXPECTED TO BE LAUNCHED DURING 1965.

Frequency (Mc/s)	Satellite Name and Purpose	Remarks
136.23	NIMBUS B – Advanced Weather Satellite	Telemetry on command
136.5	–	Continuous C.W. and command telemetry
136.95	–	Continuous telemetry
136.23	TIROS 9 – Operational Weather Satellite	Continuous C.W. beacon and command telemetry
136.92	–	–
136.275	SERB B – Radiation Belt Research	Continuous telemetry

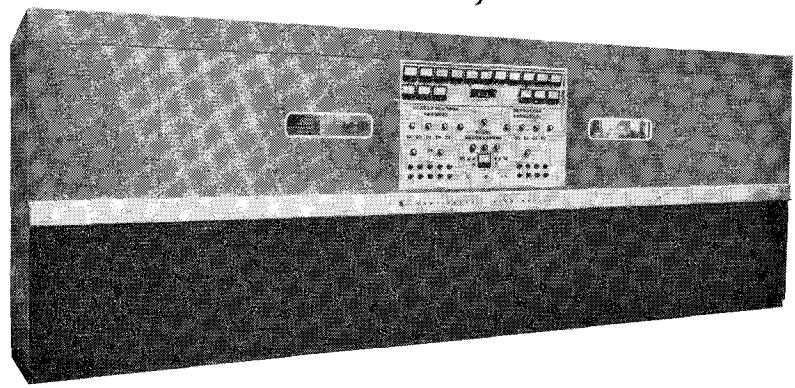
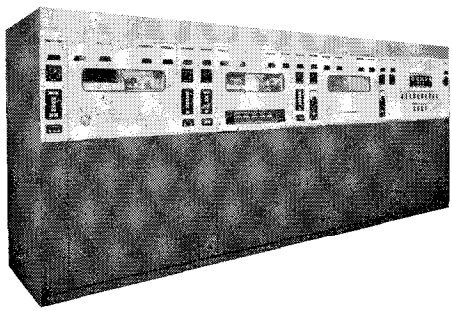
Continental Short Wave Broadcast Transmitters Set New Standards of Efficiency and Performance!



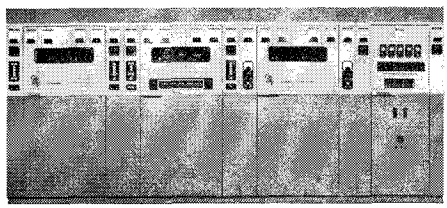
TYPE 419B 250 KW HF BROADCAST TRANSMITTER

- RF system can be operated as FSK communications transmitter independently of modulator
- Frequency range: 4 to 26 megacycles
- 20 second tuning of 10 pre-set frequencies
- High-level plate modulation
- Two parallel-connected power amplifier tubes
- Power supplies use solid state rectifiers
- Utilizes vapor phase cooling
- Capable of 100% trapezoidal modulation



TYPE 418A 100 KW HF BROADCAST TRANSMITTER

- RF system can be operated as FSK communications transmitter independently of modulator
- Frequency range: 3 to 30 megacycles
- High-level plate modulation
- One power amplifier tube
- Power supplies use solid state rectifiers
- Utilizes vapor phase cooling
- Capable of 100% trapezoidal modulation



TYPE 417B 50 KW HF BROADCAST TRANSMITTER

- RF system can be operated as FSK communications transmitter independently of modulator
- Frequency range: 3 to 30 megacycles
- High-level plate modulation
- One power amplifier tube
- Power supplies use solid state rectifiers
- Air cooled
- Can be supplied capable of 100% trapezoidal modulation

Tele-Projects Incorporated provides a complete service, available for your entire project or any portion that you may require.

The service includes the following:

- **ECONOMIC STUDIES**
- **SYSTEM DESIGN**
- **ANTENNA DESIGN**
- **ROUTE SURVEYS**
- **PROPAGATION TESTS**
- **SPECIFICATIONS**
- **INSTALLATION**
- **TRAINING**
- **CONSULTING**

Tele-Projects Incorporated's staff of experienced engineers stands ready to serve you in any of the following fields:

TELECOMMUNICATIONS
BROADCAST
TELEVISION

We specialize in and have recently installed high power transmitters and rotating log periodic antennas in Singapore, Saudi Arabia and the Republic of Sudan. In addition, we have installed a variety of communications and broadcast systems in other foreign countries.

This diversified experience enables us to tackle any job with certainty, efficiency and provide our customer with an economical system which will conform to his specific requirements.

A NEW AND EXCITING TELEVISION PROJECT

BY MICHAEL I. HAYWARD

Acting Chief, English Language Sce., United Nations Radio.

This is the story of a new and exciting television project. I am grateful to the publishers of the World Radio TV Handbook for enabling me to tell it.

For United Nations Television, this project has been a "dream" assignment: a chance to use a medium of mass communication to say something worthwhile, and say it in a human and colorful language! *International Zone: 1964*, has given us a chance to project the people in one part of the world on to the television screens of another part of the world.

During the past two decades, we have heard a lot about the "East-West" conflict. We think of it in terms of a conflict of ideology. But recently another conflict has loomed ominously on the world horizon: a "North-South" conflict.

If you look on a map, you will notice that, broadly speaking, the areas in the Northern Hemisphere are the "have" nations, the industrialized and developed countries. Vast areas in the Southern Hemisphere are the "have not" nations — many newly independent, and, most, only beginning to develop.

The conflict between the countries that "have" and the countries that "have not" is becoming sharper every day. For the first time in history, the people in the "have not" countries have become aware of their low standard of living, of their poverty, ignorance and poor health. Indeed, the Secretary-General of the United Nations, U Thant, has declared this conflict "much more real and much more serious and potentially much more explosive than the division of the world on ideological grounds".

There is much encouraging to report, however. The 1960's have been proclaimed the "Development Decade", a period for a concentrated effort to narrow the widening gap between the developed and the developing countries. The effort must be made primarily by the peoples who are demanding to cross the widening gap, of course, but they are being helped also by people in developed countries, and by people who work for international organizations. This exciting story of self-help, spurred on by assistance from others, is what *International Zone* set out to tell.

First of all, Alistair Cooke, host of the English language series, and George Movshon, Executive Producer of International Zone, set out on a round-the-world air journey to observe live situations at first hand. Three continents were chosen as locales for the programmes: Asia, Africa and Latin America.

The task was to film life in these three continents exactly as it happened, to film it in such vivid and personal terms that television audiences in developed countries could get a sense of the reality of poverty, and *change*, as it is being experienced by the people who live on the wrong side of the widening gap.

Meanwhile, "back at United Nations Headquarters", a totally new look was taken at the technical equipment required to tell the story in the best way possible.

Consider one simple problem: how to film people going about their daily lives without putting on an act for the camera. Even in a sophisticated city of the Western world, a film crew at work soon gathers a large crowd of onlookers — whether it be on Fifth Avenue or Oxford Street, on the Via Veneto or the Champs Elysée. In a small village in Latin America, or a tiny fishing port in Asia, or the bush country in Africa, the presence of a film crew could disrupt the daily routine of the entire community.

A new approach to the technical equipment for the filming was indicated. Our usual camera rigs with blimps, heavy storage batteries, powerful floodlights just would not do. We wanted to eavesdrop on life, affecting it as little as possible. Chris Lankester, Chief Sound Engineer, and Claude Houlbreque, Chief Cameraman, consulted authorities on both sides of the Atlantic — in North America and in Europe. The enthusiasm of filmmakers like Bob Drew, Richy Leacock, Don Pennybaker, who were most generous of their time and advice, convinced us that *cinéma vérité* techniques were tailor-made for our task. But a new ingredient had to be added to the conventional *cinéma vérité* rigs.

Three teams would head into areas remote from United Nations Headquarters, for four months at a time. They would frequently be away from sources of electricity, work in cold climates at altitudes up to 15,000 feet, and in hot and humid climates where the temperature would rise above 110° Farenheit. Not only would the crews have to take it, but also the cameras, the sound recorders, and the delicate electronic devices that kept sight and sound together.

So Mr. Lankester designed new modifications for the rigs (and since he volunteered to take the Asian assignment himself, there was every hope that his equipment would work!). For a time, talk of "blooplights" synchronized with "beeps", transistorized super-het receivers, tone-modulated transmitters, filled the television corridors. Until, finally, three rigs were ready to venture forth, all allowing complete freedom of camera movement by eliminating all connecting cable between camera and recorder. All were designed to be hand-held and operate with available light.

Finally, late in the autumn of last year, three teams were ready to start out, each to a different continent. The African team was headed by Gilbert Lauzun, a Frenchman, the Asian team by Peter Hollander, an American, and the Latin American team by Executive Producer Movshon, a South African. Other staff connected with the project came from Britain, Canada, Sweden, India, Australia, and Poland — a truly unique production unit, even for United Nations Television.

To prepare for this day of departure, Ben Park, an American television and radio documentarist, had been busy at work on the research and logistics. He filled up a file cabinet of documents and correspondence with the United Nations Specialized Agencies, with technical assistance experts in the field, with government officials whose support was essential, with the network of U.N. Information Centres which would facilitate the filming on the scene.

All this material was digested and drawn together in a full dossier about each situation the team was to cover. In addition, one or two alternate stories were provided in case the primary one turned out

VISUAL

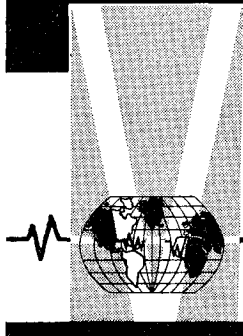
IS THE SINGLE SOURCE IN THE USA FOR

VIDEO / AUDIO EQUIPMENT

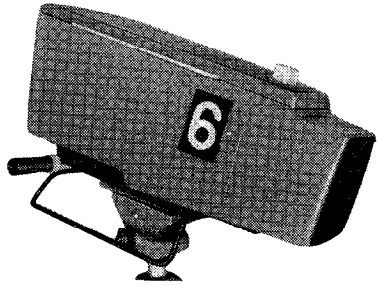
EVERY ITEM FOR RADIO AND TELEVISION BROADCASTING

Representing the Leading Manufacturers in America

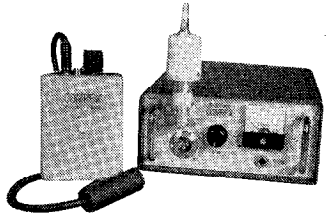
Visual Electronics — technically competent and experienced in all phases of equipment planning is your **single** source for all your broadcast equipment needs.



VISUAL ZOOM IMAGE ORTHICON CAMERA

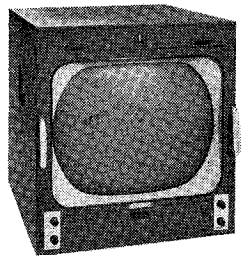


Years ahead with built-in 10:1 zoom lens, fully transistorized circuits.



COMREX WIRELESS MICROPHONE SYSTEM

Crystal controlled, fully transistorized transmitter and receiver. Extremely selective. Professional audio quality.



CONRAC 17″ TV COLOR MONITOR

Internationally recognized as the practical TV color monitor.

Excellent performance, stability and reliability — at a sensible price. Designed to meet rigid broadcast studio requirements.

Outstanding broadcasters throughout the world rely on Visual for supply of equipment of a unique nature available from major American Manufacturers.

SHORT-WAVE RECEPTION CONDITIONS EXPECTED DURING 1965

By George Jacobs, Chief, Frequency Division, Voice of America

The year 1965 is expected to have considerable scientific importance as far as short-wave reception is concerned. This is the year in which the present sunspot cycle (the 19th observed since records have been kept), is expected to reach a minimum value, and a new cycle will begin.

The present sunspot cycle began during April 1954 and reached a recordbreaking peak value of 201 during March 1958. Since that time the cycle has been declining slowly, but steadily. On the average, it takes approximately 11 years for a sunspot cycle to complete its life.

During 1964, sunspot activity ranged from a level of 19 in January to an estimated value of 9 by the end of the year. The average value of smoothed sunspot number for the year is estimated to be 14. During 1965 the cycle is expected to decline from an estimated value of 8 in January to a minimum of 5 which is predicted to occur sometime during April or May. At this point, the old cycle will end, and the new cycle (cycle 20) will begin. The new cycle is expected to rise slowly at first, possibly reaching a value of 12 by the end of the year. An average smoothed sunspot number of 7 is forecast for 1965, which would be somewhat less than was observed during 1964.

The sunspot count is an indication of the intensity of ionization in the earth's atmosphere. In turn, the degree of ionization determines what frequency bands will be received with strong, clear signals. In general, the greater the number of sunspots the greater is the intensity of ionization and the higher the frequencies that the ionosphere can reflect. During 1957-58, when the sunspot count was higher than ever recorded previously, short-wave conditions in the 26, 21, 17 and 15 mc broadcast bands (11, 13, 16 and 19 meter bands) were at their best.

As the sunspot count decreased since 1958, reception of the high megacycle bands has deteriorated, while reception of the lower bands has improved. During 1964, the best bands for long-distance broadcast reception were generally the 17 and 15 mc bands (16 and 19 meters) during the daylight hours, and the 9, 7 and 6 mc bands (31, 41 and 49 meters) during the hours of darkness. A further decrease in solar activity is predicted for 1965, with the result that reception of the higher frequency bands is expected to continue to be relatively poor, while reception of the lower frequency bands is expected to improve slightly.

The following is a general summary of reception conditions expected during 1965, by meter band:

11 meters:
Very little long-distance reception will be possible in this band during the low period of solar activity. It will be practically useless for broadcasting during 1965.

13 meters:
Some broadcasting stations will be heard in this band, especially during the winter months. Conditions are expected to be more favorable for this band during the end of the year rather than at the beginning. Conditions on this band also favor reception from southern and tropical areas than from other areas of the world.

16 meters:
Long-distance openings over many thousands of miles should be possible during the daylight hours of the fall, winter and spring months. Stations from southern and tropical areas may also be heard in this band on a regular basis during the summer months. Quite often, it should be possible to receive very distant stations with strong signals in this band.

19 meters:
This is expected to be the best band for long-distance reception during the daytime hours. Stations from all areas of the world should be heard sometime between dawn and sundown. Quite often, especially during the late spring and summer months, strong reception should also be possible during the early evening hours.

25 meters:
This is a good band for reception during the daylight hours of stations that are between approximately 750 and 2100 miles away (1250 and 3500 km). Long-distance reception should also be possible during the late afternoon and early evening hours. Very little reception is likely on this band during the hours of darkness. As the sunspot cycle nears

TABLE OF THE MOST SUITABLE METRE BANDS, 1965

The table shows the bands that are likely to be best for short wave reception to and from every major area in the world at various times of the day for the four seasons of 1965. The figures in the table should be used as a guide only. Where the band given is found to be not suitable, try the one immediately above or below. To use the table, first choose the area in which you are located, then for the time desired slide your finger across the line until you have located the area to which you want to listen, for the proper season. For example, a listener in the West European area would best receive the 16 m.b. at 14 GMT from the Eastern USA during the winter months.

Prepared by George Jacobs, Chief, Frequency Division, Voice of America.

Short-Wave Reception Conditions

Continued from page 58

its minimum value, more and more stations throughout the world are expected to make use of this band.

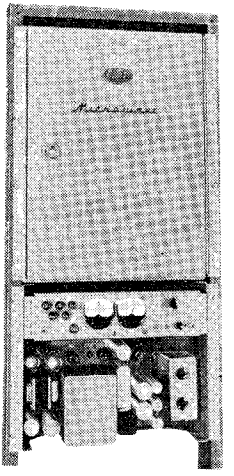
31 meters:
This is also expected to be a very good band for daytime reception over relatively short distances on the order of 500 to 1000 miles (850 to 1700 km). Fairly good long-distance reception should be possible during the hours of darkness, especially during the spring and summer months.

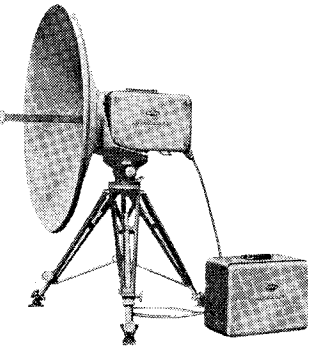
41 and 49 meters:
Good short-range reception should be possible during the daytime up to distances of approximately 750 miles (1250 km). These will be the best bands for long-distance reception during the night time hours throughout the year. During the winter months, these bands may be the only ones in which good reception may be possible after sunset. Since these are the lowest frequency bands allocated internationally, almost all broadcasters will make use of them during the hours of darkness. For this reason, there is expected to be extreme crowding and heavy interference between stations using this band during 1965.

60, 80 and 160 meters:
As the sunspot numbers decrease, these bands become more useful for regional short-wave broadcasting. In fact, conditions on these bands, especially during the hours of darkness, are expected to be better during 1965 than they have been for the past 10 years. During the daylight hours, stations within a radius of a few hundred miles should be heard well. After sunset, especially during the late fall, winter and early spring months, good reception in these bands may be possible up to several thousand miles.

For more specific reception information, please refer to the Table of The Most Suitable Meter Bands for 1965 (see above).

Your help is needed . . .
to make the WRTH even better, and that is why we ask all of our readers—listeners and radio-stations—to send in corrections and new schedules, thus enabling us to offer you an **improved** WRTH 1966 . . .





RAYTHEON MICROWAVE RELAY SYSTEMS

Raytheon's complete line of high-reliability, wideband microwave relay equipment provides point-to-point FM transmission of high quality, black and white or color television signals and program audio, wideband data or message circuits. Power outputs of 0.1 watt to 1 watt, in the frequency bands of 5925 Mc to 7450 Mc and 10,700 Mc to 12,700 Mc are provided. Dual Link Hot Standby equipment for dependable studio-transmitter circuits and Type B Video Clamper Amplifiers which remove low frequency interference are also available. Raytheon systems are also supplied in rack mounted styles and in compact luggage-type cases for portable applications. A full line of accessories and auxiliary equipment is available.

Write for FREE Raytheon Microwave System Planning Kit

Includes all technical data — together with profile and graph paper and special slide rule — for preparing microwave path surveys and site selection; describes transmission objectives, signal-to-noise factors; provides antenna system calculators, tables for rapid calculation of single-link and multi-hop performance. The Raytheon Microwave System Planning Kit is available, by request on your letter head. Please include your title and function. For your Kit and technical data on Raytheon's complete line of microwave relay systems, write: Raytheon Company, International Sales and Services, Dept. A, Lexington, Massachusetts, U.S.A.

Set Manufacturers:

RAYTHEON TV SET ASSEMBLIES FOR PORTABLES AND CONSOLES

Raytheon offers complete TV Kits, or components and subassemblies in any combination you require for use with locally obtained material to produce 19" and 23" receivers. Features include printed boards, minimum assembly and testing requirements and full engineering assistance. For complete details write: Raytheon Company, International Sales and Services, Dept. A Lexington, Massachusetts, U.S.A.

RAYTHEON

STANDARD FREQUENCY AND TIMESIGNAL STATIONS

The ordinary sw. listener soon notices a specialized technical prgr. of tones and time pulses usually received on carrier freq's of 2,5, 5, 10 or 15Mc and sometimes on 20 and 25Mc, if he listens in that part of the spectrum. These signals have many uses in science and technology. They are most useful to the non-specialist in obtaining accurate time, in checking the calibration of his radio receiver, and in gaining information on radio propagation conditions. The forecasts of the present and future state of the ionosphere can be quite useful in determining the possibilities of sw-reception. The forecasts are given by WWV, WWVH and JJY for certain parts of the globe.

R. STATION WWV, WWVH, WWVB and WWVL (Go.)

St. WWV, Greenbelt, Maryland, USA: Eng-in-Charge. L. Honea. St. WWVH, Box 578, Puunene, Maui, Hawaii: Eng-in-Charge. S. Katahara. WWVB/WWVL, Box 83-E, Route 2, Ft. Collins, Colo, USA: Eng-in-Charge. R. F. Carle – **L.P:** Chief Freq. and Time Broadc. Sce's. D. H. Andrews, National Bureau of Standards, Boulder, Colo, USA.
Standard Radio Frequencies:
WWV, 2500kc 1kW; 5000kc 8kW, 10000kc 9kW, 15000kc 9kW, 20000kc 1kW, 25000kc 0.1kW: The broadc. are continuous, night and day, exc. from 45 min. to 49 min. past each h – **WWVH,** 5000kc 2kW, 10000kc 2kW, 15000kc 2kW: Continuous exc. from 15 min. to 19 min. past each h – **WWVB,** 60kc 7kW: Continuous – **WWVL,** 20kc 1kW: Continuous, except to permit experimental changes.

Program:
WWV and WWVH transmit radio propagation forecasts in International Morse Code every 5 min's just preceding the voice ann's; the IUWDS "Geoalert" is broadc. in International Morse Code each h from WWV during the 19th min. and from WWVH during the 49th min. Universal Time is ann. from both st's in Intern. Morse Code each 5 min. At WWV a voice ann. of Eastern Standard Time is given each 5 min. as follows: "National Bureau of Standards, WWV, when the tone returns Eastern Standard Time will be... hours, ... minutes". At WWVH a voice ann. of Hawaiian Standard Time is given each 5 min's as follows: "National Bureau of Standards, WWVH, when the tone returns Hawaiian Standard Time will be... hours, ... minutes". WWVB st. identification is transmitted by keyed 600cs modulation, giving the call sign in Intern. Morse Code on the h and every 20 min. thereafter. Immediately following this, the freq. offset is given in Intern. Morse Code by keyed 600cs modulation, the letter "M" indicating minus sign. Time signal modulation (DSB) includes precise second markers of a pulse of 5 cycles of 1kc. WWVL identifies by keyed carrier giving the call sign in Intern. Morse Code on the h and every 20 min. thereafter. Immediately following identification, the freq offset is given in Intern. Morse Code by keying the carrier, the letter "M" indicating the minus sign.
V. by QSL-card or letter. **Pub:** Prgr. sched. on request.
In addition to the 20kc carrier other exp. freq's near 20kc may be transmitted alternately or simultaneously.

NATIONAL PHYSICAL LABORATORY (Go.)

Addr: Teddington, Middlesex, Gt. Britain.
MFS Standard Frequency Service:

kc	m	kW		kc	m	kW	
2500	120	0.5	continuous*	10000	30	0.5	continuous*
60	5000	10	14.29–15.30	5000	60	0.5	continuous*

MFS Standard Freq. Sce: continuous* but transmission interrupted 6 times an h at min's 5–9½, 15–19½, 25–29½ etc.
Ann: Call sign. and freq. offset (in parts in 10^{10}) 3 times in slow morse, at min's 9½–10, 19½–20, etc. in each h – **V.** by letter.

ROYAL GREENWICH OBSERVATORY

Addr: Time Dept, Herstmonceux Castle, Hailsham, Sussex, England. The international t.s's are radiated by GBR (16kc) or reserve st. GBZ (19.6kc) at 03.00, 09.00, 15.00 & 21.00 and on high freq's at 09.00 and 21.00. The freq's used are selected according to current ionospheric predictions. Freq's available: GIC24 4025kc, GAY25 5807kc, GIC26 6985kc, GIC27 7397.5kc, GIC29 9350kc, GPB30B 10331.5kc, GPB30 10332.5kc, GKU5 12790kc, GIC33 13555kc, GIC37 17685kc, GIA39 19640kc.

HBN NEUCHATEL OBSERVATORY

Addr: Neuchatel, Switzerland. **Cable:** Observatoire. **Te:** (038)-5-1238. **L.P:** Dir: J. Bonanomi, W. Schuler – On 5000kc all day long:
Prgr. of tr: continuous tr. interrupted every 5 min. for 5 min. according to the following schema: 00m 00s – 04m 50s silence, 04m 50s – 05m 00s HBN (A_2), 05m 00s – 10m 00s carrier tr. with seconds pulses, 10m 00s – 14m 50s silence, etc – Within the h, the tr. is the following: Minutes 0–5 silence, 5–10 carrier and seconds pulses, 10–15 silence, 15–20 carrier and seconds pulses, 20–25 silence, 25–30 carrier and seconds pulses, 30–35 silence, 35–40 carrier and seconds, 40–45 silence, 45–50 carrier and seconds, 50–60 silence.

TIME SIGNAL FROM DOMINION OBSERVATORY

Addr: 3, Observatory Crescent, Ottawa 4, Ontario, Canada. **Te:** 232-8211 – **L.P:** Adm: Dr. J. Hodgson. Dir. Tec: M. M. Thomson.
Stations: CHU 3330kc 90.09m 3kW – 7335kc 40.90m 3kW – 14670kc 20.45m 3kW – **T.S:** Continuous in voice and second pulses – **Ann:** English: "CHU Canada, Eastern Standard Time". French: "CHU Canada, Heure normale de l'est" – **V.** by QSL-card. Re. welcomed – **Pub:** Prgr.schedule free.

STATION JJY

Addr: Radio Research Laboratories, Koganei, Tokyo, Japan. **Te:** (0423)-8-1661 – All st's 2kW nd, 24 h: 2500kc – 5000kc – 10000kc – 15000kc.
All standard freq's are interrupted at 29–39 min. past each h. Mod. seconds pulses of 8 cycles of 1.600c/s, and 1,000c/s tone – **V.** by QSL-card. Re. to Standard Freq. Section, R. Research Laboratories, Kokubunji P.O, Koganei-shi, Tokyo, Japan.

STATION LOL

Addr: Observatorio Naval de la Secretaria de Marina Costanera Sud, Buenos Aires – **L.P:** Dir. Gen: J. Marpegán.
Standard Freq. and Signals: 5000kc 2kW – 10000kc 2kW – 15000kc 2kW – **D** 11.00–12.00, 14.00–15.00, 17.00–18.00, 20.00–21.00, 23.00–24.00, 15 Oct. to last Feb; **D** 12.00–13.00, 15.00–16.00, 18.00–19.00, 21.00–22.00, 00.00–01.00 1 March to 14 Oct. – **Schedule:** 4 min. dash (1000 or 440cs alternately) beginning at 00.00, 00.05, 00.10 etc. Then 3 × LOL in morse followed by ann. T.S. transmission at min. 55–59 in each h.

STANDARD FREQUENCY STATION OMA

Addr: Budecska 6, Praha 2, Vinohrady, Czechoslovakia. **Te:** 258757 – **L.P:** Dir: B. Sternberk.
Stations: OMA 50kc 5kW: 24 h – OMA 2500kc 1kW: 24 h – OLB5 3170kc 8kW: 18.00–05.00 – OLD2 18985kc 8kW: directed to F. East, Wed, Fri 12.30–13.00 – **Ann:** In morse-code – **V.** by letter. Re. wanted.

NATIONAL RESEARCH CENTRE OF TELECOMMUNICATIONS

Addr: Centre National d'Etudes des Télécommunications, Laboratoire de Bagneux, 196, rue de Paris, Bagneux (Seine), France. FFH: 2500kc 0.25kW: Tues & Fri 08.30–16.30.

REP. OBSERVATORY SOUTH AFRICA

Addr: Republic Observatory, Johannesburg. Tel. 43-2026. **Cable:** Astronomer – **L.P:** Dr. W. S. Finsen – **Stations:** Call ZUO: Olifantsfontein 5000kc 4kW – Johannesburg 10000kc 0.25kW – Johannesburg 100Mc 0.050kW directional. 24 h per day, exc. for interruptions 15 to 25 min. past each h.
Time Signals: Continuous second pulses, consisting of 5c/s of 1000c/s tone. The minute pulse is prolonged to about ½ second – **Ann:** In morse code every 15 min's (just before each quarter hour): ZUO, ZUO, ZUO followed by the Universal time of the next minute – **V.** by letter will be answered if they are genuine reports – **Pub:** Monthly bulletin of time and freq. correction.

RWM, MOSCOW, USSR

Addr: Ministere des Comm. postales et electriques, Moscow.
Stations: All 20kW: 5000kc 05.00–08.00, 17.00–06.00 – 10000kc 13.00–16.00 – 15000kc 01.00–04.00, 08.30–13.06.

ATA, NEW DELHI, INDIA

Addr: National Physical Laboratory, New Delhi.
Stations: 10000kc 2kW: Mon–Fri 05.30–07.30.

BPV, PEKING, CHINA

Addr: BPV, Peking – **Stations:** 5000–10000–15000kc 24 h daily.

IAM, ROME, ITALY

Addr: Istituto Superiore, Ministero P. T, Rome.
Station: 5000kc 1kW – All days exc. Sun 07.30–08.30.

IBF, TURIN, ITALY

Addr: Istituto Elettrotecnico Nazionale, Corso Massimo d'Azeglio 42, Turin – **Station:** 5000kc 0.3kW W 06.50–07.30, 10.50–11.30.

ZLFS, LOWER HUTT, NEW ZEALAND

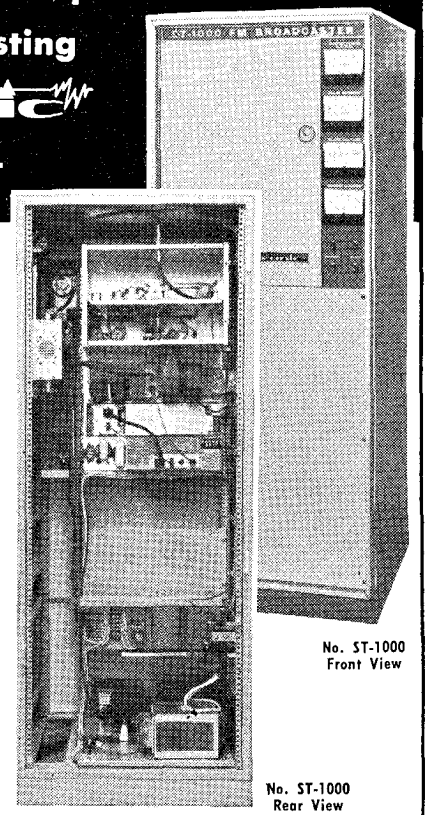
Addr: Physics & Engineering Laboratory, Lower Hutt, New Zealand.
Station: 2500kc 0.3kW: CW only Tues 01.00–04.00.

DCF77, MAINFLINGEN, GERMANY

Addr: Physikalisch-Technische Bundesanstalt, Braunschweig, Bundesallé 100, Fed. Rep. of Germany. **Cable:** "Bundesphysik". **Te:** 5921 – **L.P:** Pres: Prof. Dr. Ing. Kersten. Dir. of Dept. I: Prof. Dr. U. Stille. Dir: Dr. U. Adelsberger, Dr. Ohl, Dr. Süss.
Station: DCF77 77.5kc 12kW, nd W transm. extends essentially from 06.45–10.35, 19.00–20.10. Call-sign DCF77 in morse-code, amplitude modulation 440cs.

Newest Design, Latest Concepts of Efficiency in FM Broadcasting from Sintronic

HIGHEST QUALITY-LOWEST COST



No. ST-1000
Front View

No. ST-1000
Rear View

FM BROADCASTER

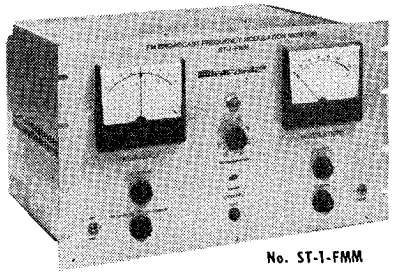
From 10-watt Exciter to 1000-watt Final without intermediate amplification stages

- Single tube final
- Maximum high voltage—2200 volts
- AC overload and airflow loss protection
- Direct modulated exciter for optimum use wtih multiplex
- Silicon rectifier HV power supply
- Self-contained harmonic filter and directional coupler

FOR THE FIRST TIME ON ONE STANDARD SIZE CHASSIS!

FREQUENCY & MODULATION MONITOR

. . . fits inside SINTRONIC FM broadcaster



No. ST-1-FMM

- Accuracy of .001% and ½db; 50-75,000 cps
- Measures all modulation including multiplex; frequency not affected
- High speed peak flash indicator (10 millisecond peaks)

Write Dept. WRT for complete information.

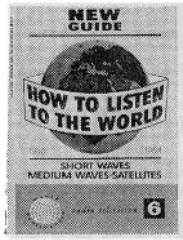
95 BROAD STREET, NEW YORK 4, N.Y. Cable: EXREGNIS



A NEW GUIDE FOR SHORT WAVE LISTENING

New and extended edition of

HOW TO LISTEN TO THE WORLD 1965

including Medium Wave-, FM- and Satellite – Listening and „How to »See« the World" (DX – TV).

1965 edition
Publication Date: At the end of january 1965.

BRAND NEW

The purpose of this publication is to assist **all** interested in listening to the world. With this helpful and handy guide you can get better reception on short waves, medium waves, FM and by listening to the satellites. A great help for the novice, an aid for the veteran and a reference book for the expert. The articles written by experts cover a wide-ranging field such as:

- **How to find and identify the stations including practical information of many short wave stations.**
- A list of all interval-signals.
- How to form and recognize a radioclub.
- How to report correct to the stations incl. tape recording of reports.
- Reception conditions in 1965.
- How to select and operate a short wave receiver.
- How to listen to Amateur stations.
- How to listen to medium wave and FM stations.
- How to receive the satellites.
- Description of short wave receivers.
- How to "see" the world. Problems connected with DX-TV.
- How to learn languages by radio?

and many more valuable and practical articles.

You will get better reception and more distant stations:

Price: Da. Kr. 16.50, US $ 2.50, £ 0/17/-, DM 9.75, Sw. Kr. 12.50. Plus transport: Da. Kr. 1.35, £ 0/1/6, $ 0.25, DM 1.00, Sw. Kr. 0.60.

ORDER YOUR COPY NOW

Publication date: End of january.

Obtainable: In USA from Gilfer Associates, Box 239, Park Ridge, New Jersey. Outside USA from booksellers or direct from:

TELESCO INTERNATIONAL CORPORATION

for broadcast equipment

CCA ELECTRONICS CORPORATION
AM and FM broadcast transmitters, antenna couplers, modulation and frequency monitors, AGC and limiting amplifiers, remote control for transmitters.

SARKES TARZIAN INCORPORATED
Television studio and transmitting equipment including live and film camera chains, optical multiplexers, slide projectors, sync generators, video switching systems including vertical interval type, studio automation systems, VHF-TV transmitters, microwave links and other items.

FAIRCHILD RECORDING EQUIPMENT CORPORATION
Monaural and stereo disk cutting systems including lathes, cutting heads, amplifiers; limiter, compressor, and power amplifiers, modular solid state amplifiers, preamplifiers, limiters, compressors, attenuators, integrated solid state speech input consoles; transcripton turntables.

ELECTRO-VOICE INCORPORATED
Broadcast and general purpose microphones, speakers and speaker systems.

CAPPS AND COMPANY INCORPORATED
Recording styli including heated types, condenser microphones.

CROWN INTERNATIONAL
Professional reel type magnetic tape recorders and reproducers, tape duplicator systems.

ROBINS INDUSTRIES CORPORATION
Tape splicers, tape erasers, phonograph and tape accessories.

TROMPETER ELECTRONICS INCORPORATED
RF and video coaxial plugs, jacks, patch panels, patch cords, and switching networks.

EZ WAY TOWERS INCORPORATED
Vertical radiators for AM broadcast, steel towers for supporting TV, FM and microwave antennas.

★

TELESCO ALSO SUPPLIES
All necessary additional items such as: TV and FM antennas, transmission line, studio-to-transmitter links, TV translators, etc.

TELESCO serves as world-wide sales representatives for leading manufacturers of radio and television broadcasting equipment. For technical and descriptive information concerning any of the products listed, contact TELESCO.

POWERED TO TUNE THE WORLD AND LOCAL FM'S FINE MUSIC!
New Zenith TRANS-OCEANIC® 9-Band Portable Radio!
MODEL ROYAL 3000-1
ZENITH
AM
FM
THE ONLY RADIO OF ITS KIND IN THE WORLD!

This famous radio—the only one of its kind known world-wide—tunes medium wave, long wave, and short wave from 2 to 9 MC... plus the 31, 25, 19, and 16 meter International bands for news direct from listening posts all over the world. That's why its full list of owners reads like an International "Who's Who"—its coverage is so broad, its station selection so precise, its performance so dependable!

Tunes Static-Free FM, Too

But, in addition to all this, the Trans-Oceanic tunes glorious FM with virtually no drift or fade. Interference, cross-talk or overlap are reduced. There is no annoying static, no wave-jamming. You hear only rich, pure, beautifully clear tone as perfected by Zenith, pioneer manufacturer of super-sensitive FM radios.

Perfect For Use At Home, At Work, At Play, Or While Traveling

If you are among the more discriminating who will treasure the distinction of owning this unique radio and the wealth of world-wide information it brings, write now for all the details on the new Trans-Oceanic plus the name of your nearest Zenith representative!

ZENITH®

The Quality Goes In Before The Name Goes On

Zenith Radio Corporation, Chicago, U.S.A.
The Royalty of television, stereophonic high fidelity instruments, phonographs, radios and hearing aids.
46 years of leadership in radionics exclusively!

Sundvej 6, Hellerup, Denmark.

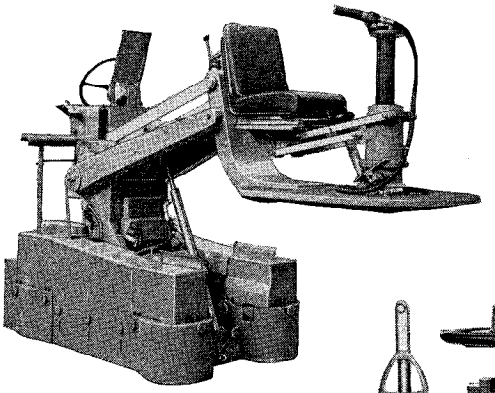
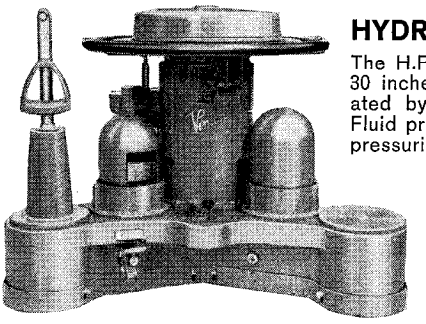
very simply

it's the finest equipment



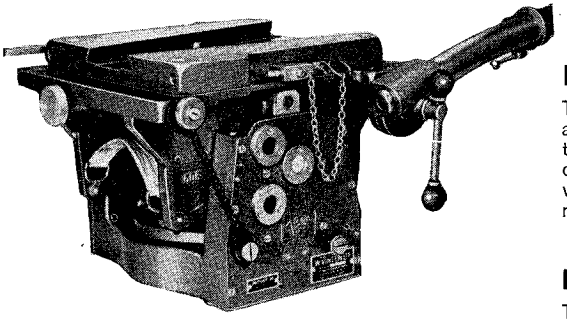
HERON CRANE

The most advanced camera crane in the world the Heron is fully mobile with all movements hydraulically controlled. Smooth, quiet running and two-man operation combine to make this the most versatile studio vehicle obtainable.



HYDRAULIC PEDESTAL

The H.P. Pedestal has a vertical travel of 30 inches, the centre column being operated by hydraulic rams in three stages. Fluid pressure is maintained by a nitrogen pressurized accumulator.



PAN AND TILT HEAD

The unique Vinten cam principle provides this head with a greater angle of tilt and perfect balance throughout the full range of tilt that is unobtainable with spring counter-balanced systems. Cameras up to 250 lb in weight can be safely carried and both pan and tilt movements are fitted with locks and friction adjustments.

FALCON O.B. DOLLY

The Vinten Falcon is designed to offer the producer of outside broadcasts equal camera mounting facilities to those in a studio. It can quickly be dismantled into four main sections for transportation and its light weight allows ease of handling in difficult environments. The Falcon offers camera shots previously unobtainable with existing equipment and combines this feature with smoothness, silence and rigidity.

Vinten

Announcing an extraordinary achievement in amateur radio

THE NATIONAL HRO-500 RECEIVER

The National HRO-500 is the result of thirty years of "improvement of the breed". From the first HRO *Senior* of 1933 to the present, the HRO series has been almost legendary. The HRO-500 continues this proud tradition, and incorporates important technological advances resulting from National's leadership in the field of solid state physics, frequency standardization, and frequency synthesis.

By any criterion, the HRO-500 is extraordinary.

1. Design Concept: The HRO-500 is totally solid state. Frequency is determined by a phase-locked crystal synthesizer* feeding a VFO-controlled tunable IF. Similar circuit techniques are found only in advanced military communications equipment.
2. Reliability: The use of transistors throughout assures amazing reliability as a result of their enormously long life and minimum heat generation. The HRO-500 is hand-wired . . . compact . . . but *not* miniaturized.
3. Versatility: The HRO-500 may be operated anywhere . . . from flashlight cells, 12 volt car battery, or from 115V/230V 50/60 cycle sources. Total battery drain is less than that required for two dial lamps.
4. Frequency Coverage: *The HRO-500 covers the entire VLF through HF spectrum* . . . Five kilocycles through 30 Mc. in 60 synthesized 500 Kc bands, with equal stability and dial accuracy throughout its tuning range. No need to confine operation to ham bands only . . . the HRO-500 provides total coverage of MARS, commercial, foreign broadcast, marine, VLF communications, test and experimental frequencies. All required heterodyne frequencies are generated by the frequency synthesizer.
5. Dial Calibration and accuracy over *the entire tuning range* is one kilocycle, employing a linear VFO and National's famous PW epicyclic dial mechanism. 1 Kc divisions are ¼" apart, allowing easy interpolation to 200 cycles or better. VFO tuning rate is identical on all bands.
6. Stability: The HRO-500 employs a 500 Kc reference crystal standard, output of which is synthesized and phase-locked to produce crystal-stable high frequency oscillator signals. The VFO is electronically regulated. The use of transistors throughout practically eliminates internal heat generation. Long term stability from turn-on is better than 100 cycles over any ten-minute period, including supply voltage variation of ±10% and ambient temperature variations of 30° C.
7. Selectivity: The HRO-500 employs a *tunable* six-pole filter to meet any selectivity requirement. Bandwidths available are 500 cycles, 2.5 Kc, 5.0 Kc, and 8.0 Kc . . . the widest selectivity range of any amateur receiver. *Passband Tuning* in the 500 cycle and 2.5 Kc positions provides ease of sideband selection and adjacent channel interference rejection found in no other receiver manufactured today. A *Rejection Tuning* network allows rejection of interfering heterodynes by 60 db.
8. HRO-500 sensitivity and noise figure is substantially superior to the previous standard of comparison, all earlier HRO models!

Amateur net price will be approximately $1000.00, with delivery this fall. If your requirements demand the finest amateur receiver obtainable at *any* price, the National HRO-500 is your only choice.

*Patent Pending

The modest voice of nature

Gevasonor magnetic sound films

The song of a bird, the sound of a wave, the cry of a child. The endlessly changing din of a large city. The hundred or more instruments of a symphony orchestra. Capture them all with Gevasonor magnetic sound films.

In countless film studios all over the world, Gevasonor magnetic sound film has proved to be an invariably high class film which guarantees faithful reproduction, even of notes of the highest frequency. Polished Gevasonor film is suited for all recording apparatuses, including yours !

Gevasonor sound film is supplied in many types, including :

Type 2.01 : the standard magnetic sound film, fully coated with an iron oxide layer ; available in 35, 17,5 and 16 mm widths.

Type 2.02 : magnetic film, also fully coated with high output iron oxide and available in 35, 17,5 and 16 mm widths.

Type 2.21 : with magnetic track and balance stripe for the synchronisation of 35 mm film productions.

It is the meaningful application of high grade individual components that makes electronics work. Assembled into racks — **as plug-in units** — they are well adapted to an easy and quick replacement whenever trouble will arise. Trouble shooting is simple, the source of troubles is quickly found, test results are unambiguous, production is economical. The **TK** DESIGN PRINCIPLE is consistent with the laws of physics, its precision means superior quality. The self cleaning multiple contact connectors are low-loss, vibration-proof and satisfactory even under all extremes of climate — theirs is an unsurpassed operating reliability. **The Plug-in Philosophy** signals technological progress; plug-in electronic units are the only solution to many problems of technology and economy — hence use plug-ins. **Where to provide plug-ins?** Applications may be found in any field of technology, in electronics as well as machinery. **When to provide plug-ins?** Right at the outset of the design project in order to provide a wider range of applications for your product and give it a „pre" over competitors. **What to provide with plug-ins?** Electronically controlled components for any machine — heavy machinery — electronic systems. **How to provide plug-ins?** By means of the **TK** DESIGN PRINCIPLE. Consult our experts.

THE TK DESIGN PRINCIPLE MEANS SAFETY

FREQUENCY BANDS ALLOCATED TO BROADCASTING, TELEVISION AND AMATEURS

The table is based upon the Geneva Regulations 1959. Some bands are shared with other services. In certain countries exceptions from the table below apply. **Region 1**: Europe, U.S.S.R. in Asia, Africa. **Region 2**: N. and S. America, Northeast Pacific. **Region 3**: Asia exc. U.S.S.R., Australia, N. Zealand, part of Pacific. [1]) Certain countries only, max 10W, special agreements.

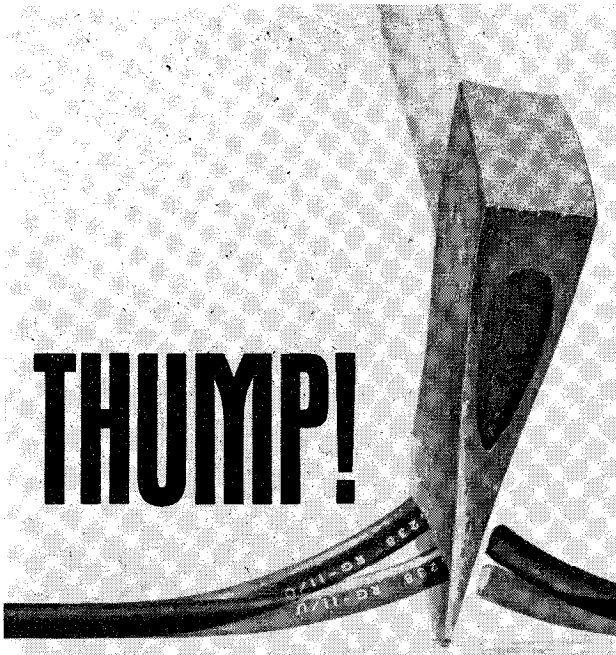
THUMP!



THE NEW FREEDOM

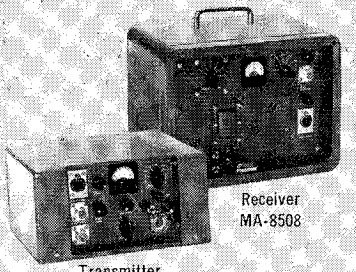
Microwave Associates — an established major U.S. supplier of communications and defense equipment — applies its solid state-of-the-art know-how to a new series of mobile TV equipment for broadcasters.

A complete transmitter and receiver microwave link — rugged, small enough to carry easily, powerful enough to transmit 12 miles without boosters, sufficiently self-contained to operate with battery pack — offers unmatched programming coverage at a small fraction of weight and power consumption of klystron transmitters and receivers.

At the 1964 political conventions, major TV networks used this equipment for remote live pickup — by helicopter, crash truck, even on foot. Outstanding for "live" coverage of sporting events or news.

Used back-to-back, the receiver-transmitter combination can serve as an unattended relay. Traveling wave tube boosters extend the range to as much as 50 miles. All equipment is full FM video and sound and meets appliçable CCIR and FCC requirements.

Write for complete details on these, rack mounted STL, and point-to-point relay equipment.



Receiver
MA-8508

Transmitter
MA-8507

AVAILABLE EQUIPMENT SUMMARY

Frequency	Transmitters	Receivers	TWT Power Boosters
1.990–2.110Gc	MA-8507 7 channels 1 watt output	MA-8508 7 channels Crystal Controlled	MA-8509 10–20 watts output
6.325–6.525Gc or 6.875–7.125Gc (Specify Band)	MA-8517 400 mW output	MA-8516 Crystal Controlled	MA-8518 20 watts output
		MA-8521 TDO Equipped — Tuneable 12; 24 VDC, 110 VAC Compatible KTR — 1000G or R.C.A.	
11.7–12.2Gc or 12.7–13.2Gc (Specify Band)	MA-8514 75m watts output (Development)	MA-8512 Crystal Controlled (Development)	MA-8513 10–15 watts output

Recommended accessories including tripods, antennas, batteries, cables also available.

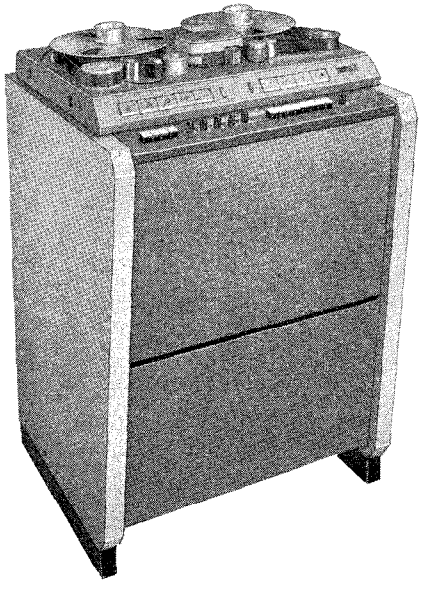
EMT
The Modern Studio Equipment for Broadcasting and Recording Studios



STUDER J 37-4-1
FOUR-TRACK ONE INCH MASTER TAPE RECORDER

For the simultaneous recording on 1" wide tape of four signals of full track width. Recording may be made on any of the four tracks in any combination while at the same time playing back from any of the previously recorded tracks. A built-in four-channel "guide track" amplifier permits monitoring of the record head output for overdubbing purposes.

EMT is world famous for its program of specialized professional equipment for broadcasting and recording. EMT delivers professional tape recorders, turntables, reverberation generating units, and test equipment.

SUMMER SUPPLEMENT 1965

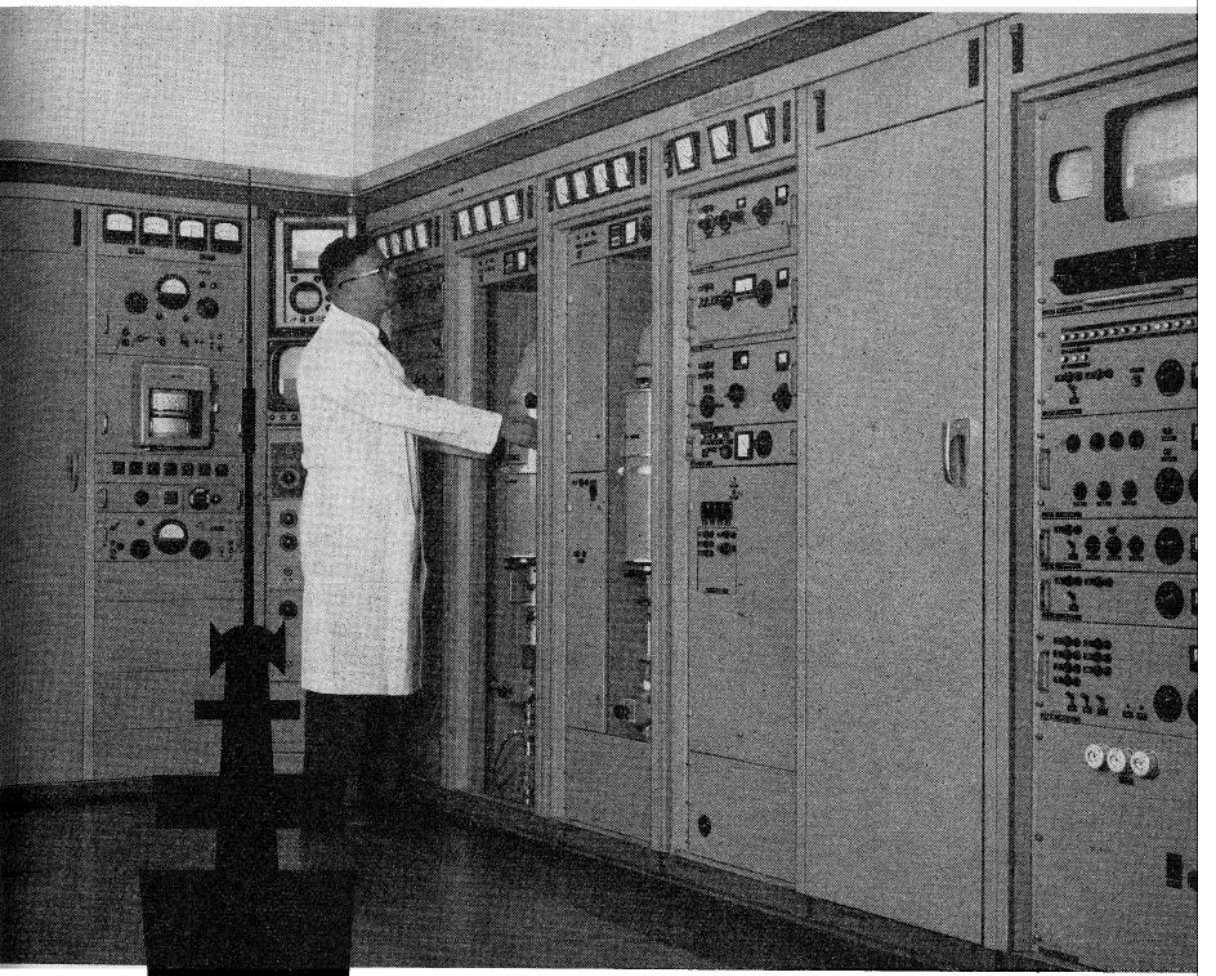
With this up-to-date guide, you can have as much pleasure monitoring shortwave during the summer as you do the other seasons of the year. Many broadcasting stations revise their schedules for that period. The 1965 Summer Supplement – issued in June 1965 – will contain hundreds of changes in time schedules and programming and will bring your World Radio Television Handbook 65 right up to the minute including the summer schedules of the major broadcasting and shortwave stations. So there is no need to give up your hobby during that time. You can still monitor the many important stations around the world which are usually received with good volume at certain times of the day throughout the summer and autumn season.

There are approximately 80 pages of program details on thousands of stations and in addition you receive a complete up-to-date table of shortwave stations in the world. To make sure of getting your copy, we suggest that you send us your order as early as possible. Price: $ 1.80, £ 0/12/0, D. Kr. 12.25 per copy, plus postage $ 0.20, £ 0/1/6, D. Kr. 1.25 per copy.

World Radio TV Handbook Co., Ltd,

Sundvej 6, Hellerup, Denmark

SIEMENS



Transmitters and Antennas for Television and Broadcasting

All frequency bands and power levels
High reliability by automatic changeover facilities
Facilities for remote control and remote supervision

TOMORROW'S BROADCASTING EQUIPMENT TODAY!

from SINGER PRODUCTS COMPANY, INC.

Your Single Source for Everything in Broadcasting and Communications

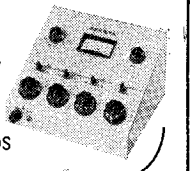
AUDIO CONSOLE
PORTABLE STUDIO
by SPARTA

producers of the equipment that broadcasters want.

LOW COST AUDIO CONSOLE

Main Studio, Production Studio, Remote Amplifier. Features and flexibility found only in the most expensive studio equipment.

- Eight inputs
- FREQUENCY RESPONSE: ± 2db 30-20,000 cps

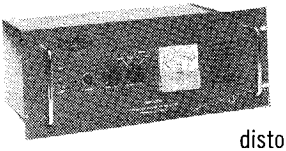


PORTABLE STUDIO

Complete, professional production studio, main studio, or remote studio at a fraction of the cost you would expect. Consists of Audio Console (available separately) — two heavy-duty professional turntables, broadcast quality viscose-dampened tone arms. Legs removable.

RE-BROADCAST RECEIVER
by McMartin

manufacturer of over 90% of all rebroadcast receivers and monitors in use throughout the world.



Built for reliability, performance and economy; for all rebroadcast and monitoring applications.

- 600 ohm program amplifier with output level control—distortion less than 1% at +10 dbm
- Sensitivity 1.0 microvolt for 30 db quieting
- Separate monitor amplifier, self-contained speaker and phone jack (for external speaker or earphone)

SYMMETRA-PEAK
by KAHN RESEARCH LABORATORIES

outstanding research laboratories

- Increases effective power and station coverage
- Symmetrically distributes unequal positive and negative peak energy of audio waves • No power source or maintenance required

NEW! CSSB GENERATOR

- Triples effective radiated power without adding one watt to the antenna!
- Improves audio fidelity
- Compatible with all existing AM Transmitters and Receivers — no engineering modification required
- Reduces adjacent and co-channel interference
- Thoroughly proved — simple to install and operate — does not require critical or repeated adjustments

Products shown on this page are just a few examples of what SINGER has to offer.

Write Dept. WRT for complete information.

The Broadcasting Corporation of Northern Nigeria was formed in 1961 by the Government of Northern Nigeria in partnership with the Granada Group Ltd. and EMI. As main contractors, EMI planned, installed and commissioned the complete sound and television service. This included the supply of a shortwave and a medium wave transmitter, two vision transmitters, five aerial towers and the 500 ft. mast radiator, together with microwave links and the associated vision and sound studio equipment. As shown in the diagram the first TV transmission began in Kaduna, followed by a shortwave sound broadcasting network. A second main TV transmitter was built at Jaji. A repeater station is used at Auchan, centrimetric microwave link equipment is used to Wak, followed by a further link to Kano. EMI Electronics Ltd. began work on the installation in January 1962 working to a carefully phased plan which was to be implemented without any interruption of programmes. EMI plan, produce and install complete television broadcasting systems . . . everything from camera to aerial.

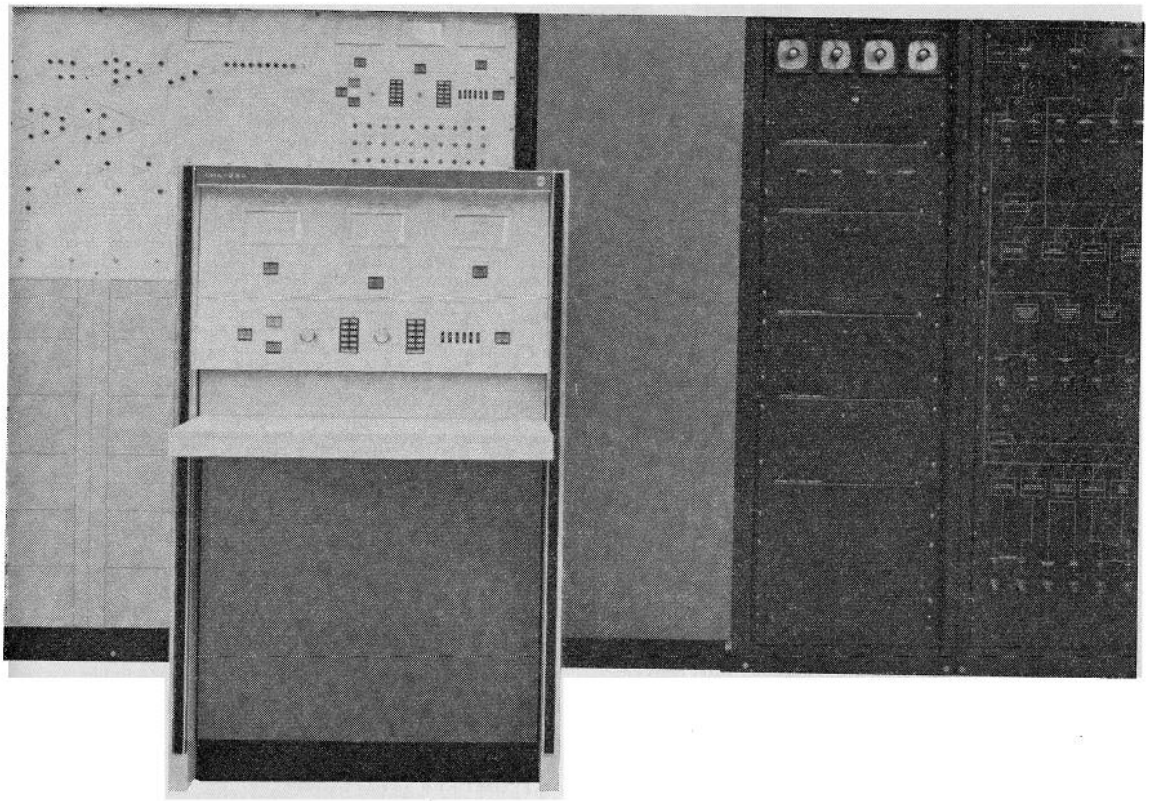
★ To get the most out of your hobby, you should join a DX club. Go first class; make your club the NNRC.
★ Annual dues, $ 5.00 U.S.; sample Bulletin, 25 c.

Newark News Radio Club, 215 Market Street, Newark 1, New Jersey, U.S.A.



Make an Extra Hour or More of "Air-Time" Per Day*

*Four daily frequency changes with the average HF broadcast transmitter can lose up to one hour of "on-air" time. With the Collins' 821-A automatically tuned 250 kw transmitter, this time can be saved to provide the equivalent amount of program transmission.

The Collins 821-A 250 kw, HF broadcast transmitter offers features never before available.

20-SECOND AUTOMATIC TUNING — Change frequencies automatically in the 3.95 to 26.5 Mc/s range in a maximum of 20 seconds — less for smaller frequency changes. Make preset frequency changes during normal station breaks.

CONTACT ELIMINATION — Sliding, rolling and switching contacts in the Power Amplifier r-f circuits *are eliminated* for greater reliability and decreased maintenance.

REMOTE OPERATION — A control console permits operation of the transmitter from a remote location.

FLEXIBLE INSTALLATION — The transmitter can be installed in a variety of configurations in only 800 sq. ft. Easily adaptable to existing structures. If desired, Collins will provide complete installation service.

These are just a few of the features in Collins' new 821-A 250 kw, HF transmitter. There are many more. For complete information, call or write today.

GREETINGS FROM

RADIO ★ PRAHA

ČSSR

RADIO PRAGUE

Broadcasting daily in English, Arabic, Czech, Slovak, French, German, Greek, Italian, Portuguese, Serbo-Croat, Spanish and Swedish – programmes of world news and views, reports from Czechoslovakia, music. Programmes also include answers to listeners, musical requests and regular columns for radioamateurs, DXers, and stamp collectors.

A MESSAGE TO SWLs

Radio Prague is carrying out a continuous reception survey. *All correct reception reports are verified.* Listeners participating regularly in the monitoring work for the short-wave propagation department receive valuable souvenirs from Czechoslovakia.

Every month first-hand information on the world of broadcasting is offered to you in the

EBU REVIEW

Published in English and French by the European Broadcasting Union

Part A — Technical will keep you informed of all new technical developments in sound and television broadcasting.
— *Articles written by specialists describe typical new* installations, new operational methods and research work undertaken by the broadcasting organizations.
— The "International News" section is devoted to news items reported by EBU Members concerning the installation and operation of transmitting stations and studio centres, recording equipment and outside broadcast facilities, both for sound and for television.
— Each number gives a summary of the changes that have taken place during the previous two months in the spectra of the long, medium and metric (FM) sound broadcasting wavebands and of the television wavebands.

Part B — General and Legal — brings you authoritative reports on radio and television developments throughout the world in the non-technical fields. Specialists *write on the latest trends in*

programming, administration, and planning,

progress and activities are reported from the international sphere, and from broadcasting organizations in over 60 countries

experts analyse legislation and jurisprudence touching on broadcasting, new Copyright Acts, etc.,

special numbers are published on key subjects, including educational broadcasting, television graphics, agricultural broadcasting, Eurovision.

ANNUAL SUBSCRIPTION

Part A (six numbers): 150 Belgian francs. Publishers: EBU Technical Centre, 32 Avenue Albert Lancaster, Brussels, Belgium.

Part B (six numbers): 15 Swiss francs. Publishers: EBU Administrative Office, 1 rue de Varembé, 1200 Geneva, Switzerland.

A combined subscription to Parts A and B (12 numbers) may be ordered either from Brussels or Geneva (price 300 Belgian francs or 27 Swiss francs).

telecommunication journal

In the increasingly international age in which we live, it is more important than ever that everyone connected with radio should be in touch with authoritative world opinion on radio matters.

The Telecommunication Journal, the official organ of the International Telecommunication Union (ITU), serves just this purpose. Since 1869 (when it first appeared as the "Journal Télégraphique") it has faithfully covered all aspects of telecommunications which come within the purview of the world organization (now a UN specialized agency) set up in 1865 to regulate them.

The journal contains

- a news section covering the activities of the ITU, of its Member Administrations and of private operating companies and highlighting technical advances in radio throughout the world –
- articles by world experts, with a heavy emphasis recently on the latest developments in space communications-
- a monthly "Telepersonality" featuring an outstanding personality from the telecommunication world –
- a comprehensive list of articles of telecommunication interest appearing in the scientific press throughout the world –
- official ITU information, including lists of forthcoming ITU Conferences and other international telecommunication meetings –
- monthly sunspot predictions.

During 1965 the Journal will be marking the ITU's Centenary.

It is published monthly by the ITU in separate English, French and Spanish editions.

It costs 2 Swiss francs a copy. The annual subscription is 20 francs for one language edition, 30 francs for two and 40 francs for three.

For further information, write to: Telecommunication Journal, ITU, Place des Nations, Geneva, Switzerland.

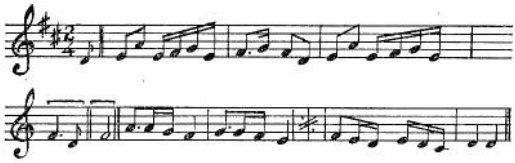
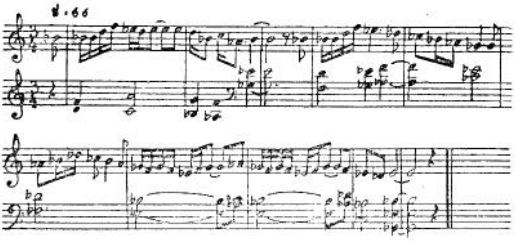
NORSK RIKSKRINGKASTING

(THE NORWEGIAN BROADCASTING CORPORATION)

ANN: "This is Radio Norway with its shortwave service for Norwegians abroad".
INT-SIG: Every s.w. transmission is introduced by the following theme, which originates from an ancient folk tune from Hallingdal.



Five minutes previous to every s.w. tr. the following signal is sent:



Message to our English-speaking audience: In our daily prgr's for Norwegians abroad we will usually have a section of Norwegian music or music presented by Norwegian artists. This musical section, which lasts 15 to 20 minutes, is introduced in English as well as in **Norwegian.** On Wed and Sat you can listen to our **"Letter Box Programme"**, in which we play our listener's request records. We often receive letters from listeners in Norway with request to play a record with a greeting to one of their relatives abroad, but we regret to be unable to comply with these requests. Every Sunday we have an additional prgr. in English, **"Norway this week"**, in which we try to present Norway in different ways through music and feature prgrs. We are very grateful for comments on our transmission. Reports are answered by QSL-card. Return postage is not necessary. Our postal address is: **Radio Norway**, Oslo, Norway.
PUB: Programbladet (weekly), Prgr.schedule free on request.

The Marconi Company Ltd. G. B. delivered: Oslo 2×100kW, 1×2 kW, 1×1¼kW. Stavanger 11×5kW, 5×900W, 1×10W tr's.
AKG, Austria, delivered studio equip. (microphones).
Telefunken AG, Germany: studio equip. (recorders).
Wilh Franz KG, Germany: EMT studio equip.

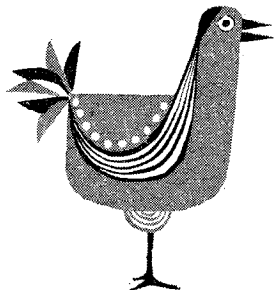
Advertisement



The Swedish interval-signal is taken from Swedish Broadcasting Corporation bird recordings which are available on discs.

. . . The records of Swedish birdsongs are magnificent to say the least – such nice selections . . . so little background noise

Arthur A. Allen, Cornell University.

. . . Radio Sweden have issued the most comprehensive collection of European bird voices . . . and about two minutes of each species . . .

James Fisher in a transmission of the BBC, January 1963.

Ask for catalogue in English and order discs from The Swedish Broadcasting Corp., Box 955, Stockholm 1, Sweden.

The Broadcasting House in Moscow

THIS IS RADIO MOSCOW!

RADIO MOSCOW may be heard abroad in 52 foreign languages and 10 languages of the USSR on both short and medium waves. All continents are covered.

For the Soviet point of view on foreign affairs and firsthand information on life in the Soviet Union, tune in to RADIO MOSCOW.

Besides the news, reviews of the Soviet press, talks and interviews, Radio Moscow's external services carry special programmes for women and youth, features on science and engineering, sports and literature. No less popular is the wonderful music from Moscow.

RADIO MOSCOW regularly broadcasts the programmes of its youth radio station "Mayak" ("Beacon").

RADIO MOSCOW has as its guest speakers top Soviet politicians, public leaders, scientists and artists, as well as visitors from abroad.

Listeners' letters are answered both on the air and by mail. Request music programmes are featured regularly and quizes with prizes for listeners are popular.

TUNE IN TO RADIO MOSCOW!

ADDRESS: RADIO MOSCOW, MOSCOW, USSR

NHK

NHK or the Japan Broadcasting Corporation is Japan's only non-commercial public broadcasting service financed solely by radio and television subscription fees. The sole object of NHK is to promote the general welfare of the public to raise the cultural level of the people through broadcasting.

The photograph indicates the rapid development of NHK. From right to left, the Main Building, Annex, and Second Annex. NHK is also constructing its Broadcasting Center at Yoyogi, Tokyo. This will be 7-storied building with a total floor space of 65,000 square meters.

Frankly, WRTH is not for everyone.
It is not for the person with an idle mind—but written and prepared for the listener and radio-station, etc. with an open mind to what is going on within the wonderful world of Radio and TV . . . So we hope that the WRTH is for you—and that's why we invite you to take advantage of the yearly **Summer-Supplement** to the WRTH, which is published in June each year bringing your WRTH completely up-to-date. Available from your bookseller—or from WRTH Co. Ltd. —at the following prices:
$ 1.80, £ 0/12/0, D kr. 12.25 per copy, **plus postage:** $ 0.20, £ 0/1/6, D kr. 1.25 per copy.

RELAY STATIONS:
For frequencies of the relay stations, refer to the individual countries: Germany, Greece, Great Britain, Morocco, Ceylon, Ryukyu Islands, Philippines, Liberia.

ANNOUNCEMENT:
Each program ends with these words spoken in English: "This program has come to you from the United States of America". The station identification is then announced in English.

INTERVAL SIGNAL:
Choir of brass playing a 10 note version of "Columbia, the Gem of the Ocean". This musical symbol is played at the beginning of a transmission, during station breaks, and at the conclusion of a transmission. At the beginning of a transmission the sign on announcements is followed by 3 minutes of musical symbol made up of alternate 5 seconds music and 5 seconds silence.

VERIFICATION by QSL-card. No return postage required.

ARMED FORCES RADIO and TELEVISION SERVICE

ADDR: Hqs: Directorate of Armed Forces Information and Education, Washington D.C, 20305.
FI: By state (Dept. of Defense.)
This office exercises over-all policy control of the Armed Forces Radio and Television Service. The mission of AFRTS is to keep U.S. Service men and women stationed outside the States the best informed service personnel in the world on current events. **All broadcasts are in English.** News, sports and other timely matter is beamed overseas directly by ten powerful tr. on the U.S. Atlantic and Pacific coasts. These s.w. broadcasts serve the overseas radio stations, which rel. them locally. Prgrs. other than news and locally produced prgrs. are derived directly from the U.S. Commercial radio and tv. networks. N. is compiled from the wires of A.P. and U.P.I. and include voice actuality and "from the scene" report segments. Regular shortwave prgr's are presented daily from both Los Angeles and New York City, over the tr's of the V.O.A. The operational headquarters of AFRTS, at Los Angeles, ships undated radio and tv. prgrs. on transcription and film, respectively, to overseas stations, and controls the Pacific Shortwave Service.

PACIFIC SERVICE (from Los Angeles):
ADDR: AFRTS Shortwave 1016 No. McCadden Place, Los Angeles. Calif. 90038. **Te:** Hollywood 23301 – **L.P:** Officer-in-charge: Col Robert R. Eby, USAF.
D.PRGR'S: 21.30–16.30(Nov 64–February 65).

PRIVATE STATIONS

GOVERNMENT AGENCY:

THE FEDERAL COMMUNICATIONS COMMISSION (FCC) the licensing agency for broadc. st's.

Addr: P.O. Dept. Bldg, Washington 20554, D.C – L.P (key officials): Chmn: E. W. Henry. Executive Dir. C. B. Plummer. Secr: B. F. Waple, Chief, Broadcast Bureau: J. B. Sheridan, Chief, Reports & Information: G. O. Gillingham.

The FCC is an independent Federal agency, composed of seven Commissioners appointed by the Pres. by and with the advice and consent of the Senate. One of its major activities is the general regulation of broadc. – *now visual as well as aural. This regulation may be divided* into three phases: 1) The allocation of spectrum space to the different types of broadcast services, 2) Considerations to build and operate individual stations, 3) Regulating their operation.

Call letters. – International agreement provides for the national identification of the radio st. by the first letter or first two letters of its assigned call signal, and for this purpose apportions the alphabet among different nations. USA st's use the initial letters K, N, and W, exclusively, and part of the A series. Broadcast st's are assigned call letters beginning with K or W. Generally speaking, those beginning with K are assigned to st's west of the Mississippi River and in the territories and possessions, while W is assigned to broadcast st's east of the Mississippi.

Number of Broadc. St's in the USA as of July 1st, 1964:	Authorized	Operating
AM comm.	4061	3976
FM comm.	1371	1181
FM educ.	257	243
TV comm.	669	583
TV educ.	257	80

In addition, 1913 translator pick up and rebroadcast TV programs of regular TV stations.

EDUCATIONAL

Department of Health, Education, and Welfare, Office of Education, Washington D.C. 20202; Office of the Under Secretary: I. A. Nestingen.

The Educational Television Facilities Programme designed to encourage establishment of new and improved broadcast facilities through financial grants based on matching funds.

Office of Education, Media Research and Dissemination Branch, Ag. *Dir: Th. D. Clemens. Educ. Media Specialist: Mrs. G. Broderick.* Provides a variety of services by professional staff specialists to schools and college officals, st. operators, and others, as requested. Under Title VII of the National Defense Education Act, finances research and experimentation in the educ. uses of all media; disseminates information on the subject through conferences, seminars, workshops, and publication of pertinent bulletins.

Organisations:

National Association of Educational Broadcasters (NAEB). *Headquarters: 1346 Connecticut Ave, N.W. Washington D.C. 20036.* **Te:** 667-6000 – **Publications and Network Office:** 119 Gregory Hall, Urbana, Illinois 61803. **Te:** 333-0580.

L.P: Pres: W. G. Harley, Vice-Pres: H. E. Hill. Ag. Pres. (TV): C. Scott Fletcher. Vice Pres. (TV): G. L. Appy.

STATIONS: 196 educational institutions and organizations owning and operating a total of 222 educational radio and TV stations. **FI:** By membership fees. Also some support from outside sources for special research projects. The national independent professional asso*ciation, which since 1925 has represented the interests and needs of* educ. television and radio broadcasters, represents appr. 75% of the educ. st's and production centers of the United States (appr. 90% exc. those identified as religious st.).

Activities and Functions: The NAEB is the Association of American institutions operating educational, cultural and public Sce's radio and TV st's and production centers. Publish a monthly Newsletter, a semi-monthly Washington Report, and a bi-monthly Journal. The NAEB also operates a radio network which duplicates via tape and distributes to members st's five hours of programming per week. At present there are some 150 st's in this network. Exchanges of prgr's with other nations are welcomed. It also actively cooperates with various intern. organizations (European Broadcasting Union, UNESCO etc.), and the national systems of various other countries. *According to FCC regulations, non-comm. educational FM st's have* no restrictions on transmission time.

National Educational Television Center, Coliseum Building, 10 Columbus Circle, New York 19, New York.

Provides a prgr. sce. to affiliated educ. t.v. st's throughout the USA. Major support for the 10 years of existence has come from the Ford Foundation.

Radio – By action of the FCC, 20 channels are reserved in the FM radio band for non-commercial educ. use. More than 200 st's are *operating in this reserved band. In addition, some 30 st's which began* on AM operating in the early days of radio are still in operation. Some of them have dual outlets in the FM band. These st's provide both in-school and out-of-school prgr's to the communities in which they operate.

Television – In April, 1962, the FCC announced the reservation of approx. 12% of available t.v. channels for non-comm. educ. use. Reserved channels presently total 350 in the VHF and UHF bands, of which 80 are presently on the air. The st's are licensed to State Departments of Education, to city school systems and to individual universities, or to community corporations which embrace entire school and cultural organizations within a community.

COMMERCIAL STATIONS

NATIONAL ASSOCIATION OF BROADCASTERS

ADDR: 1771 N. Street N. W. Washington, D.C. 20036 – **Te:** Decatur 2-9300.

Purpose: The purpose of the Association is to foster and promote the development of the arts of aural and visual broadc. in all its forms; to protect its members in every lawful and proper manner from injustices; to do all things necessary and proper to encourage customs and practices which will strengthen and maintain the broadc. industry to the end that it may best serve the public.

L.P: Chmn: W. Schroeder. Sec-Treasurer: E. E. Revercomb.

Members as of Oct. 1, 1964, AM Radio 2082 – FM Radio 792 – TV stations 445 – Radio Networks 4 – Television Networks 3. Associate Members 154.

M.W. Stations operating with a power of 10 kW and above.

The time each station is authorized to operate is indicated in the list. Each station is required to operate at least two-thirds of the hours it is authorized to operate between 6:00 AM and 6:00 PM, and two-thirds of hours it is authorized to operate between 6:00 PM and midnight. If authorized to operate unlimited time, it may operate for the entire 24 h.

INTERNATIONAL BROADCAST STATION KGEI

FI: By donations, non-profit, non-comm. org's. KGEI (the Voice of Friendship) is owned and operaed by the Far East Broadc. Co. Inc, Whittier, California.

Even the Shotgun can miss . . .
A high-velocity advertizing blast in newspapers, national magazines, etc. can be devastating . . . but is it hitting the bull's-eye? Getting to your potential customers at the moment when they are ready to buy? There is one sure way to do that. The World Radio TV Handbook . . . People within your line of business just naturally look to the WRTH, when they are ready to buy . . . What a time to tie in with your big-blast advertising . . . — with selling ads in the World Radio TV Handbook . . . — the Bull's Eye . . .

Short Wave listeners can hear a different sound when they tune to Radio New York Worldwide

Radio New York Worldwide is not an ordinary short wave station. It is different because it is privately owned and operated. It is the only daily advertising and public relations vehicle reaching more than 100,000,000 radio receivers in Europe, Africa and Latin America. It is different because the programs are more entertaining and more timely.

With on the spot live news reports coming to you from 55 correspondents in every area of the globe, with BILLBOARD selections of top music and records from around the world, and with business and stock price reports from the major financial centers . . .

You are better informed!

Radio New York Worldwide invites your participation in the most exciting radio schedule on the air. Send for your free program guide and remember your world is a better one, when you listen to:

RADIO NEW YORK WORLDWIDE

Worldwide Communications Center
4 West 58th Street
New York 19, N.Y., U.S.A.

FOR COMPLETE PROGRAM LISTING SEE OPPOSITE PAGE.

Some Exciting and Important Radio New York Worldwide programs

ENGLISH

Breakfast in New York: The excitement of New York at the start of a new day as reflected by its music and conversation. John Anthony Zee conducts this daily feature, beginning at 1200 GMT.

Chroniscope: A full 35-minutes of news and comment, including news by continent with special reports for Asia, Europe, Africa and the Americas; direct broadcasts from the New York Exchange, featuring latest financial news; sports and background to the news; presented six times daily.

The Worldwide Hit Parade: Radio New York Worldwide's most popular program, featuring five full hours of the hits of today and tomorrow in the pop field, jazz, and country music. Albums and singles will be featured at 1600 GMT, Monday through Friday, Saturday at 1200 GMT.

This World We Live In: With Hill Edell. The variety program with exciting conversation, music, and the popular feature "Listener's Request", beginning at 1730 GMT, Monday through Friday.

Special Programs: Radio New York Worldwide as a variety of exciting special programs every week, including interviews with famous people. Check your programs like "Report From New York", "Mel In Manhattan", "Book World", "Travel Worldwide", "Great Moments In History", and "Commerce Worldwide".

The Sounds of New York: Weekly review of the exciting sounds and people that make news and music in the great metropolis.

SPANISH

Prisma Continental: The nightly feature of late news, and direct reports, from spanish speaking correspondents around the world.

Radar: A daily variety program beginning at 2200 GMT, including interviews, comments, sports results, late news, and, most of all, the best in popular music.

Clave: A fast moving program of great variety, featuring a pot-pourri of the best of Radio New York Worldwide program features.

Always . . . in English or Spanish, complete coverage in depth of the major news and sports events of our time ... on Radio New York Worldwide. See complete station listing on page 206.

WORLD TELEVISION

The principal CCIR* television systems:
Definition refers to the standard which is normally stated in terms of the number of lines which make up the image. Reference in the following surveys is made throughout merely to 405 lines, 525 lines, 625 lines, 625 lines (OIRT**) and 819 lines respectively.

Number of lines per picture	405	525	625	819
Video bandwidth (Mc/s)	3	4	5	10.4
Channelwidth (Mc/s)	5	6	7	14
Sound carrier relative to vision carrier	−3.5	+4.5	+5.5	±11.15
Sound carrier relative to edge of channel	+0.25	−0.25	−0.25	+0.10
Interlace	2/1	2/1	2/1	2/1
Line frequency (c/s)	10.125	15.750	15.625	20.475
Field frequency (c/s)	50	60	50	50
Picture frequency (c/s)	25	30	25	25
Sense of vision modulation	Positive	Negative	Negative	Positive
Level of black as percentage of peak carrier	30	75	75	25
Sound modulation	AM	FM	FM	AM

* The International Radio Consultative Committee.
**The characteristics are the same as 625 lines exc. for a difference in bandwidth: video bandwidth 6Mc, channelwidth 8Mc, sound carrier relative to vision carrier +6.5Mc.

The following pages give you the data for the different TV stations of the world. The channel is indicated by a letter followed by a figure. The letter indicates the technical data of the systems which are in use (A: American, B: British etc.) and the figure is the channel number.

The power for vision and sound are indicated by a fraction, the numerator indicating the number of kW (ERP) for vision and the denominator for sound, for example 6/1.5 means vision 6kW ERP and sound 1.5kW ERP.

Differences in Belgian TV from resp. CCIR 625 and French 819:	CCIR 625	Belgian 625	French 819	Belgian 819
Video bandwidth (Mc)			10.4	5
Channelwidth (Mc)			14	7
Sound relative to vision			−11.15	+5.5
Sound relative to edge of ch.			+0.10	−0.25
Vision modulation	Negative	Positive		
Level of black as percentage of peak carrier	75	25		
Sound modulation	FM	AM		

United States of America. Number of lines: 525.

[1] London. [2] Nr. Huddersfield. [3] C. Scotland. [4] Channel Islands. [5] Norwich. [6] N.E. Scotland. [7] Isle of Man. [8] N. Ireland. [9] Isle of Wight. ø) Directional transmitting aerial.

D.Prgr: All stations: Trade Test tr's: Mon–Sat 10.00–13.00. Prgr. (hours approx): Mon–Fri 10.00–12.00, 14.00–14.40. For Schools (during term-time), 14.00–15.30; 17.00–23.05. Sat 13.45–23.00. Sun 14.00–18.15, 19.00–23.00.

The BBC has started a second TV prgr. on UHF on 625 lines as opposed to the existing prgr. on VHF on 405 lines. This second prgr. called BBC-2 started on April 20th 1964 for viewers in the London area and it is expected that by 1966 it will be extended to 75% of the UK, giving a planned alternative prgr. to BBC-1. The BBC anticipates that it will introduce colour television broadc. by early 1967 although no decision has yet been made about the system of transmission which will be employed.

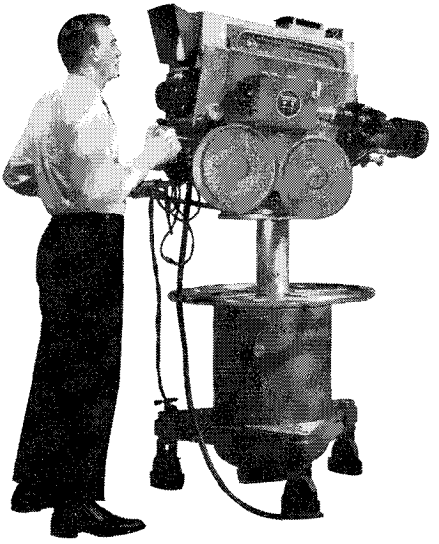
THE REVOLUTIONARY GEMINI TAPE/FILM SYSTEM



NOW AVAILABLE TO TV STATIONS and VIDEO TAPE PRODUCERS

GEMINI is a fully perfected system which produces simultaneous, direct 16mm film during videotape production. GEMINI replaces the kinescope with a dependable, high quality motion picture film. Developed by MGM Telestudios, the GEMINI system uses a 16mm camera unit mechanically and optically coupled to the TV camera. No special lighting is required. Normal good television lighting yields good GEMINI film. If proper, simple procedures are followed, the picture on the TV monitor will faithfully be reproduced on 16mm film. Our exclusive Edilite system, feeding off the tally lights, marks the film with a line of light when the camera is "taken." Most editing, therefore, becomes automatic in a zero cut printer, and does not require the physical cutting of the film.

Every Television broadcaster, studio and producer that uses electronic cameras has a need to record a portion of his total production. Videotape supplies this need in many cases. However, the cost of videotape equipment, stock and handling represents a financial burden in many situations. Particularly is this true where programming is to be widely distributed within and outside the country, such as in the case of producers of entertainment programs, educational material, industrial features, commercials, training programs, etc.

Also, foreign distribution of videotape is generally impractical because of differences in technical standards throughout many countries of the world. However, every TV station in the world is equipped to use 16mm film, and regular projection equipment for group screenings is universally available and commonplace. The GEMINI system fulfills this recording and distribution need with economy, dependability and quality, backed by the reputation of the world's foremost production organization.

The world's number one TV newsfilm service

It's UPI Newsfilm, the world-wide television newsfilm service of United Press International.

Camera crews on every continent work closely with 264 UPI news and picture bureaus in 62 countries.

Complete global news coverage on film is furnished daily to more than 450 independent and network television stations in 53 countries.

Operation is around the clock, around the world, with 50,000 feet of film processed daily.

UPI Newsfilm is the world's largest newsfilm gathering and distribution agency. No other service comes close to matching it.

52 GLORIOUS WEEKS IN 23 COUNTRIES.

$1,081,000.

That includes everything!

Full sponsorship of a hit half hour show. In prime time. On 52 stations. In 23 countries. Reaching more than 16,000,000 TV homes.

No other advertising medium abroad has the selling power of television. And only ABC International lets you use it so effectively.

As the world's largest buyer of programs for telecast abroad, we seek out top shows in all major production centers. This is why our ABC Worldvision stations can deliver your sales messages with maximum efficiency.

And ABC International offers many *other* advantages!

Option-time arrangements that make optimum time periods available. Centralized buying procedures—and special time discounts—that can save your company a good deal of money. Flexibility enough so that you can use the entire network—or any of the 52 stations.

If you have a product that you want to move abroad, ABC International Television has the ticket for you.

We'll air your commercials on our ABC Worldvision Network.

And millions of responsive families will get the message!

The ABC Worldvision Network: Canada, Mexico, Dominican Republic, Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, Panama, Venezuela, Ecuador, Brazil, Argentina, Lebanon, Iran, Nigeria, Japan, Okinawa, Philippines, Australia, Syria, Haiti, Netherlands Antilles.

A New and Exciting Television Project

Continued from page 56

to be disappointing once the team-leader looked at it on the spot.

Despite the thoroughness of the research that had gone into the dossiers, each team-leader was given the widest discretion on story development, and the crews were chosen on their ability to relate to people. No scripts, no treatments, were drawn up in advance. No stage directions to be used, for the essence of the filming consisted in bringing back a faithful record of life as it was being lived by the subjects of the film. So an extra heavy burden was thrown upon the U.N. film and sound reporters. They had to recognize an interesting or significant scene when they saw it, and they had to be ready to work as an integrated unit to get it recorded at the instant it happened.

Each team, therefore, was given a thorough indoctrination about the new and sophisticated electronic equipment they were to work with. As portable and transistorized as the rigs were, each team had to carry some 240 kilos (over 500 pounds) of equipment. They exposed a quarter of a million feet of 16 mm film. This averaged a ratio of 20 feet shot for every foot finally used in the thirteen half-hour programmes.

The film crews covered about 65,000 miles. (African crew, 22,000, Latin American crew 13,000, Asian crew 29,000). The job could not have been done otherwise, with real stories to be got from such distant places as Ubol, in Thailand, Tsaramody in Madagascar, and Salvador in Brazil.

In Africa, Lauzun's film team made the trip from Bamako to Timbuktu by plane, jeep and riverboat. The Latin American crew, headed by Movshon, found itself working at altitudes up to 15,000 feet in Colombia and Peru, were forced to regiment their labor into short periods rather than risk physical breakdown in the unaccustomed rarified air.

In Thailand and India, Hollander's crew had no choice but to live and eat exactly as the people of the area do, because they were far from those places ordinarily visited by Western travellers.

All the crews managed to enjoy these experiences and would not have foregone them had they been able to choose differently. Some things they might have changed, had they been warned. The African team, eager to document all the aspects of local life in Madagascar, subjected themselves to witnessing a ceremony wherein a young bull was sacrificed; they filmed the entire scene, little of which remains in the finished programme — out of respect to sensitive television viewers.

One of the Latin American crew members, Ron Fleher, broke several small bones in his foot, stumbling through the rocky paths of a Colombian town; another — cameraman David Myers — escaped serious injury when his shoulder-borne camera rig took the brunt of a hard fall in the mountain of Peru.

The Asian crew faced some tense moments when fierce Moroccan tribesmen took exception to the cameraman's innocent mistake of attempting to photograph their women.

But most of the crews' assignments were memorable because of the friendliness of the people they encountered. On their last day in Kumariawas, the U.N. filmmakers were covered with layers of flowers by the villagers. In Colombia, the team was tendered a huge party by the men of the town of Mongui.

I believe that readers of this Handbook the world over will be interested in the thirteen programmes of *International Zone: 1964*. The language recorded by the teams in all cases is the language spoken locally by the subjects, and a wide variety of language, indeed! There is English, French, Spanish, Portuguese, to be sure; but also Hindi, Thai, Lao, Singhalese, from Asia, and Malgache, Yoruba, Hausa, Fante, Ibo, and others, from Africa. So production in all languages will be equally possible, and I look forward to seeing the *International Zone: 1964* series on the television stations of many countries beyond the usual English-speaking region.

TABLE OF SHORTWAVE STATIONS to the Summer-Supplement 1965.

In order to make this as complete and up-to-date as possible we direct an earnest appeal to **all radio stations using shortwave** to send us regularly their transmission- and/or programme-schedules.

The **World Radio TV Handbook** is the only international handbook which contains complete and exact information about all broadcasting and television stations in the world.

World Radio TV Handbook is used by the managing directors and engineering staffs of radio and television stations. Equipment manufacturers looking for world markets are thus presented with an ideal medium for reaching all their potential customers in this fast growing field.

These facts give authority and weight to a sales message in the **World Radio TV Handbook.** It will help increase your sales because it will reach the technical staffs of radio and televisions stations, institutions, organizations, amateurs and short wave listeners.

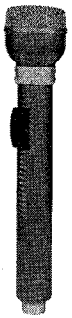
Million-dollar Studio

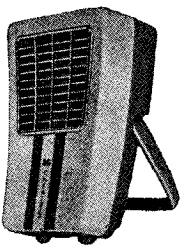
or

Fifty-dollar Mike

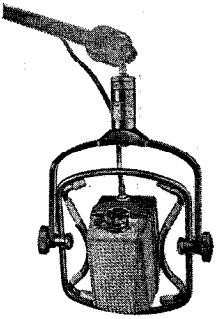
?



D19CS



D11C



D25B

★ A million dollars might buy you an acoustically-perfect recording studio, free of low-frequency reverberation.

★ Fifty dollars will buy an AKG dynamic cardioid microphone that does the same job, retains its directional selectivity clear down into the bass and makes even a »live« livingroom a recording studio.

Of all microphone makers, AKG of Vienna has the basic patents on dynamic mikes with full-range cardioid response — the characteristic that alone makes this possible. AKG's cardioids are cardioid where you need it most!

This is only one of the plus values in an AKG. They are all rugged ... smooth in their translation of sound ... built with care and oldworld craftsmanship.

From von Karajan to Joe Doakes, AKG is first choise for crips, full-bodied sound. From $ 485 to $ 27*), AKG dynamics are the cardioidest dynamic mikes you can buy today.

*) US-retail prices.
